Message Implementation Guideline for Airlines
UN/EDIFACT
PAXLST/CUSRES
Message Sets v3.5

January 3, 2011

Document Number: 2099001-UN-IMPLEMENTATION-GUIDE-3.5

Suitable for Public Dissemination
Executive Summary

Background

This document is based on the WCO/IATA/ICAO Advanced Passenger Information Guidelines, with Department of Homeland Security (DHS) additions, and contains the technical guidelines for carriers to follow in the preparation and transmission of the passenger/crew manifest data for processing by DHS. The technical guidelines are based on the DHS Consolidated User Guide (CUG) for APIS Pre-Departure and Secure Flight.

A standard data format known as UN/EDIFACT – United Nations/Electronic Data Interchange for Administration, Commerce, and Trade – was adopted by the United Nations Economic Commission for Europe (UN/ECE). A version of the UN/EDIFACT “PAXLST” message set has been codified by the World Customs Organization (WCO) and the International Air Transport Association (IATA) for worldwide use by all scheduled air carriers and border control authorities. Additional PAXLST message segments, data elements, and code values have been defined by DHS as necessary to meet the requirements of U.S. regulations.

Notes:
1. All examples in this document are fictional. There is no implication that any carriers operate flights with the numbers shown or fly these routes. Any resemblance to real people, their documents or itineraries, or any personal details, is strictly coincidental.

6.12.1 NAD Example .......................................................................................................... 91
6.12.2 NAD Element Definitions ......................................................................................... 91
6.13 Attribute (ATT) – Traveler Gender .................................................................................. 93
6.13.1 ATT Example ............................................................................................................ 93
6.14 Date/Time/Period (DTM) – Traveler Date of Birth ......................................................... 94
6.14.1 DTM Example .......................................................................................................... 94
6.14.2 DTM Element Definitions ........................................................................................ 94
6.15 Process Information (GEI) – Verification Indicator ......................................................... 95
6.15.1 GEI Example ............................................................................................................ 95
6.15.2 GEI Element Definitions .......................................................................................... 95
6.16 Free Text (FTX) – Bag Tag Identification Reporting ...................................................... 96
6.16.1 FTX Example .......................................................................................................... 96
6.16.2 FTX Element Definitions ........................................................................................ 97
6.17 Place/Location Identification (LOC) – Residence / Itinerary / Birth ............................... 98
6.17.1 LOC Example .......................................................................................................... 99
6.17.2 LOC Element Definitions ........................................................................................ 100
6.18 Communication Contact (COM) – Traveler Contact Information ................................. 102
6.18.1 COM Example ........................................................................................................ 102
6.18.2 COM Element Definitions ....................................................................................... 102
6.19 Employment Details (EMP) – Crew Member Status / Function .................................... 104
6.19.1 EMP Example ........................................................................................................ 104
6.19.2 EMP Element Definitions ....................................................................................... 104
6.20 Nationality (NAT) – Traveler Citizenship ..................................................................... 106
6.20.1 NAT Example .......................................................................................................... 106
6.20.2 NAT Element Definitions ....................................................................................... 106
  • Reference (RFF) – Traveler Identification ...................................................................... 107
    • RFF Example ............................................................................................................... 107
6.21 Document/Message Details (DOC) – Traveler Document(s) ......................................... 109
6.21.1 DOC Example .......................................................................................................... 110
6.21.2 DOC Element Definitions ....................................................................................... 110
6.22 Date/Time/Period (DTM) – Traveler Document Expiration ........................................... 112
6.22.1 DTM Example .......................................................................................................... 112
6.22.2 DTM Element Definitions ....................................................................................... 112
6.23 Place/Location Identification (LOC) – Document Issuing Country ............................... 113
6.23.1 LOC Example .......................................................................................................... 113
6.23.2 LOC Element Definitions ....................................................................................... 113
6.24 Control Total (CNT) ..................................................................................................... 114
6.24.1 CNT Example .......................................................................................................... 114
6.24.2 CNT Element Definitions ....................................................................................... 114
6.25 Message Trailer (UNT) ................................................................................................ 115
6.25.1 UNT Example .......................................................................................................... 115
6.25.2 UNT Element Definitions ....................................................................................... 115

1. Introduction

The purpose of this manual is to provide guidelines to air carriers for the preparation and transfer of manifest data using UN/EDIFACT PAXLST and CUSRES format. These implementation guidelines identify the technical requirements of DHS for collecting passenger and crew data from air carriers flying with domestic and international nexus.

1.1 UN/EDIFACT Message Format

In 2002, a standard Electronic Data Interchange (EDI) message set was approved for use by the United Nations/Electronic Data Interchange for Administration, Commerce, and Trade (UN/EDIFACT) under the auspices of the United Nations Economic Commission for Europe (UN/ECE). The World Customs Organization (WCO) and the International Air Transport Association (IATA) and adopted the Passenger List (PAXLST) message set for use by all scheduled air carriers for the transmission of passenger and crew data to border control authorities. This UN/EDIFACT PAXLST and CUSRES Message Set documentation identifies the format and syntax rules that scheduled air carriers must follow in transmitting data to the appropriate authorities in the U.S.

DHS has found it necessary to extend the WCO/IATA standard PAXLST to meet certain legislative and regulatory requirements that are currently unique to the U.S. However, every effort has been made to conform to the overall UN/EDIFACT PAXLST standard. The extensions use standard UN/EDIFACT segments and data elements, as well as private code sets in certain segments where they are allowed.

In addition to the PAXLST standard message set, the UN/EDIFACT CUSRES (Customs Response) message is used in this implementation. The CUSRES message is used as a DHS response message returned to the aircraft operator in response to a PAXLST. The DHS CUSRES Response message provides the aircraft operator the results of the passenger screening and vetting conducted by DHS systems. No extensions to the UN/EDIFACT standard CUSRES message were necessary for this implementation.

1.2 Messaging between DHS and the Aircraft Operator

The exchange of EDI messages between the aircraft operator and DHS primarily involves two explicit UN/EDIFACT message sets indicative of the typical request / response message process flow. Additionally, DHS may send an unsolicited message in a separate messaging process, to alert the aircraft operator of a change in airworthiness status for a previously vetted passenger.
Passenger Clearance Request and DHS Response Messages

The message from the aircraft operator requesting passenger clearance will be the form of the UN/EDIFACT PAXLST message. DHS will use the information received in this message to clear each passenger identified in the message against the DHS watch list.

**Note:** Aircraft operators using the UN/EDIFACT format to submit data to DHS as required by APIS Pre-Departure and/or Secure Flight Passenger Data (SFPD) must properly code each PAXLST submission to indicate whether the submission is to be routed to APIS Pre-Departure or Secure Flight. (Refer to Sections 5 and 6 for the technical message specifications for the PAXLST).

The DHS response message returned to the aircraft operator will appear as a UN/EDIFACT CUSRES message. This message will identify the airworthiness status of each passenger identified in the PAXLST message sent to DHS. (Refer to Sections 7 and 8 for the technical message specifications for the CUSRES).

DHS Unsolicited Message

Updates to the DHS passenger watch list involving passengers previously vetted through the above processes, will result in DHS sending a notice to the aircraft operator identifying such passenger status change. This message will appear as a uniquely identified version of the UN/EDIFACT CUSRES message. This message will identify the new status as applied to the specific passenger identified in the CUSRES message. (Refer to Sections 7 and 8 for the technical message specifications for the CUSRES).

All DHS Unsolicited messages will require a carrier acknowledgement response, regardless of the vetting result of the indicated passenger. The acknowledgement message returned to DHS in this case will be a unique version of the UN/EDIFACT CUSRES message. (Refer to Sections 9 and 10 for the technical message specifications for this CUSRES).

1.3 General Notes for this Guide

- This document is intended to be a technical guide for explaining the UN/EDIFACT PAXLST and CUSRES syntax as implemented by DHS. Some data elements marked as “conditional” under the PAXLST may be mandatory under certain regulations. This guide does not attempt to explain all of the situations in which various conditional elements must be present, and it should not be seen as a substitute for DHS laws and regulations. The DHS Consolidated User Guide (CUG) contains reporting requirements. Every attempt has been made to ensure this guide conforms to those reporting requirements, but in all cases, the DHS laws and regulations take priority over the contents of this guide.

- Frequently, the word “person” or “traveler” is used when an explanation applies equally to either a passenger or a crew member.
• Unless otherwise noted, “crew” also refers to “non-crew”. The terms are roughly defined as follows:
  • A “crew” member is defined as a pilot, copilot, flight engineer, airline management personnel authorized to travel in the cockpit, cabin crew, or relief crew member.
  • A “non-crew” member is defined as an air carrier employee or family member, or person traveling onboard a commercial aircraft for the safety of the flight (e.g. an animal handler). Note the non-crew definition only applies to all-cargo flights – these travelers should be reported as “passengers” on passenger or mixed passenger / cargo flights.
1.4  **Electronic Data Interchange (EDI) Standard Messaging - UN/EDIFACT**

DHS supports two distinct UN/EDIFACT standard messages for electronic information exchange with aircraft operators for program compliance. The PAXLST standard message is used primarily for reporting of passenger and crew information. The CUSRES standard message is primarily used as a response to the PAXLST to report the vetting status of passengers. Tables 1 and 2 below identify uses of the specific messages. Technical details concerning message layouts are further described throughout this document.

1.5 **Functional Uses for the UN/EDIFACT PAXLST Message set**

The PAXLST message is used in this implementation to support a number of critical information reporting functional requirements. These include:

- Passenger Reporting – (Clearance Requests, Updates, Additions, Deletes)
- Crew / Master Crew Reporting - (Updates, Additions, Deletes – APIS only)
- Cancel Reservation
- Reduction in Party
- Change Passenger Data
- Cancel Flight - (CBP AQQ – International Flights only)
- Flight Close-Out - (CBP AQQ – International Flights only)
- Gate Pass - (TSA Secure Flight – Domestic Flights only)
- Change Itinerary / Flight

**Functional Reporting Rules**

As indicated above, support for some of the functional uses of the PAXLST vary between the TSA Secure Flight program and the CBP AQQ Pre-Departure program. The unique functional support and processing rules for each program follows:

**Passenger / Crew Reporting** –

*For Secure Flight (Domestic Flights) – Passengers Only* – Any passenger information not previously received by Secure Flight will be included in a PAXLST message and submitted to Secure Flight. A passenger will be considered to be unique for a flight when the PNR locator and the Unique Passenger Reference identifiers do not match an existing record. The ‘Change Passenger’ function must be specifically implied (Refer to BGM segment detail Section 6.5.2) to update previously provided passenger information.

*For AQQ (International Flights) – Passengers* – Any passenger information not previously received by AQQ will be added to the flight manifest. An ‘add’ or ‘update/change’ function does not need to be specifically implied on the PAXLST. A passenger will be identified as **unique under either of the following circumstances:**

1.) The Passenger Name Record Locator (PNR) and the Unique Passenger Reference identifiers do not match an existing record, or
2.) The Last Name + First Name + Date of Birth do not match an existing record, when a PNR is not provided.

DHS will recognize that a traveler record was previously reported (i.e. by exact Name / Date of Birth match), and replace the **entire** previous record with the new data.
Carriers may resend the PAXLST message in order to update APIS data that was not previously provided or to receive an updated ESTA status from DHS.

*Crew / Non-Crew – AQQ should not be used as the submission method for reporting of crew information. Reporting of crew information should continue to be sent to APIS utilizing the non-interactive batch APIS submission method and format. Per normal, the carrier, or submitter of the Crew/Non-Crew message to APIS will receive an email confirmation of the crew submission.*

*In the event crew data is sent using the interactive function, vetting responses will not validate the crew members standing on the carriers Master Crew List. This function is a separate requirement and must be maintained through normal Master Crew List updates.*

**Cancel Reservation –**

*AQQ and Secure Flight programs both support the Cancel Reservation function. The reservation to be cancelled must include the PNR locator and the Unique Passenger Reference. The complete originally provided itinerary must also be identified in this message. The DHS Response Message returned to the aircraft operator will contain a general response without vetting results.*

**Reduction in Party –**

*AQQ and Secure Flight programs both support the Reduction in Party function. This function removes a passenger from a multi-passenger PNR reservation. The PAXLST message would include only those passengers remaining on the booked travel under the PNR identifier. The complete originally provided itinerary must also be identified in this message. A DHS Response message acknowledging receipt of the message will be returned to the aircraft operator but will not contain passenger vetting results.*

**Change Passenger Data –**

*AQQ and Secure Flight programs both support the Change Passenger function. The Change Passenger Data function uses the data contained for the passenger(s) identified on the ‘CP’ PAXLST message type and overlays the information previously presented for the passenger(s) whose data has changed. Change Passenger Data transmissions should only contain the information for the specific passenger that is to be changed. New vetting results will be returned on the DHS Response Message for all passengers identified on a Change Passenger message.*
A previous passenger submission containing name and date of birth that is changed to include travel document information would be considered Change Passenger submission.

Carriers may use a Change Passenger message to report passenger data updates, to provide additional passenger data required for APIS submission and/or to receive an updated ESTA status from DHS.

**Cancel Flight** –

*For AQQ only* – The complete originally provided itinerary must also be identified in this PAXLST message. No passenger data should be provided in this message. The DHS Response message returned to the aircraft operator will contain a general response without passenger vetting results.

**Flight Close-Out** –

*For AQQ only* - The Flight Close-Out message reports the total number of passengers who are on the flight. Additionally, this PAXLST message is used to report either (1) the identity of the passengers who are on the flight, or (2) the identity of the passengers who were previously reported to AQQ but did not board the flight. Passengers are identified with PNR locator and the Unique Passenger Reference. The response to this message from AQQ will be in the form of a DHS general response. Passengers identified on a Flight Close-Out message will not be re-vetted. The DHS Response message returned to the aircraft operator will contain a general response without passenger vetting results.

**Gate Pass** –

*For Secure Flight only* – The Gate Pass PAXLST message is used to request access to the secure airport environment for a non-traveling party. Along with the full name and date of birth of the party seeking access, the aircraft operator must provide an assigned Unique Passenger Reference identifier and the PNR number of the accompanying traveler that uniquely identifies the party and will be returned in the DHS response message. The Gate Pass request message must also include the airport location code. A vetting result will be returned on the DHS Response Message for the party identified on a Gate Pass message.

**Change Itinerary / Flight** –

*For Secure Flight domestic only* – The Change Itinerary / Flight function alerts DHS to a change in flight number(s), origin and/or destination airport(s), and/or scheduled departure(s) or arrival time(s) of a passenger(s) whose Secure Flight Passenger Data (SFPD) has been previously submitted. Secure Flight will update the passenger(s) records but no passenger vetting will take place. A DHS Response message
acknowledging receipt of the message will be returned to the aircraft operator but will not contain passenger vetting results.

**NOTE:** Carriers submitting messages with an international change in itinerary / flight must submit a new Clear Passenger message.

1.6 **Data Communications**

1.6.1 **Air Industry Networks**
DHS currently supports receipt of transmissions through two air industry communications networks: Aeronautical Radio Incorporated (ARINC) and Societe Internationale de Telecommunications Aeronautique (SITA). Carriers desiring to use either of these communication services should contact them directly for additional information and technical details.

These networks may have limits on the size of certain types of messages, which may require larger messages to be split into multiple "blocks." Refer to Section ‘1.7 Data Transmission Rules’ below for instructions regarding the transmission of multiple 'blocks' (messages).

(NOTE: Type “B” messages are no longer limited to a length of 3840 bytes. SITA and ARInc now support Type “B” message lengths up to 64,000 bytes. DHS strongly encourages use of the maximum block size, as this will simplify carriers’ systems and result in faster DHS processing.)

1.6.2 **Communicating Directly with DHS**
DHS offers external commercial trading partners a number of methods to communicate electronic documents directly with DHS. All of the communications options identified below involve the use of IBM Websphere MQ for assured message delivery between DHS systems and Aircraft Operator systems. For more information regarding communicating directly with DHS:

- Go to [WWW.CBP.GOV](http://WWW.CBP.GOV)
- Enter 'VPN Solution' into the search box, hit go
- Choose link to 'Which VPN Client is Right for My Company'.

**Dedicated MPLS Communications**
This communications option leverages a ‘Multi Protocol Label Switching’ (MPLS) dedicated VPN (Virtual Private Network) circuit hosted by either Verizon or Sprint networks. Licensed IBM Websphere MQ Server software is required.

**Hardware VPN Internet Solution**
This option leverages the World Wide Web for purposes of message exchange. Licensed IBM Websphere MQ software is required.
**Software VPN Internet Solution**  
This option utilizes a dual freeware solution whereby both MQ Client software and Cisco client software support messaging across the internet.

**eAPIS Web service**  
This solution utilizes a web service developed by CBP, for users maintaining a lower volume of APIS submissions. Utilizing an activated eAPIS account, select the ‘Help’ option for further information.

### 1.7 Data Transmission Rules

DHS views a transmitted message as a single continuous bit stream. A single transmission of a message to DHS must consist of a well-formed, syntax compliant, single instance of a PAXLST or a CUSRES message. For aircraft operators using Websphere MQ for their transmissions, a single MQ message must contain a single instance of a PAXLST or a CUSRES message. If an aircraft operator encounters message size limitations (due to network transmission size or other system limitations), messages may need to be split into separate transmissions, or blocks. If this is necessary, each block must constitute a stand-alone EDIFACT PAXLST or CUSRES transaction that can be processed whether or not any other associated blocks are received.

The following rules must be followed for all messages sent to DHS:

1. A single transmission (message) sent to DHS must include **only one** instance of a PAXLST message set, or a CUSRES message sent to DHS in response to an Unsolicited DHS message.

2. Only a UN/EDIFACT segment terminator, one byte in length, serves to separate the message into “records” (segments).

3. Each block must have a complete set of UNB, UNH, UNT, and UNZ header/trailer segments. If UNA, UNG, and UNE segments are used, they must also be present in each block.

4. Each block must have a BGM segment and contain the TDT and flight itinerary segments.

5. An individual traveler’s data must not be split into multiple blocks. All data for a specific traveler must be contained within the same block.

6. The sender may choose to use fields in the UNH segment to specify a block sequence number and indicate the initial and final blocks that are being sent. *It is
important to note, there is no guarantee that DHS will receive and process the blocks in the order that they were sent. While DHS may use the block sequence numbers and the initial/final indicators as a reference for troubleshooting missing or corrupted blocks, DHS will not employ an automated validation or reporting of “missing” blocks.

1.8 Data Quality

With the increasing volume and importance of the data being sent to DHS, the quality and uniformity of data transmissions is of great concern. DHS filers should be aware of the following policies:

- Message syntax rules described in this document must be followed. This includes mandatory values for specified data elements and coding practices for groups of data segments (such as the flight itinerary). Transmissions that fail to follow these rules and practices may be rejected by the system. Also, certain syntax errors such as those involving a required segment for a segment group may cause the data for subsequent travelers in the transmission to be lost.

- No exceptions to the syntax rules will be made for any filer.

- Qualification testing must be passed before actual “live” flight data will be accepted. Do not submit UN/EDIFACT transmissions to the DHS production system without expressed prior approval.

1.9 Confirmation/Acknowledgement of Transmissions

DHS will send an application generated confirmation message to the sender after receiving and processing a PAXLST transmission. The confirmation is sent as a UN/EDIFACT CUSRES message.

Aircraft operators are required to acknowledge all DHS Unsolicited messages. Unsolicited messages from DHS also appear as a uniquely identified UN/EDIFACT CUSRES message. The acknowledgement message returned to DHS from the aircraft operator will contain similar content as the CUSRES Unsolicited message received from DHS.
1.10 **Synchronous and Asynchronous data Transmissions to DHS**

Data transmissions to DHS can be achieved using either synchronous or asynchronous processes. Synchronous transmissions are those that expect near real-time replies, while asynchronous transmissions are one-way conversations.

Synchronous process are traditionally used during request/response operations, whereby an aircraft operator performs a request and waits for a response from DHS before continuing (blocked mode).

Asynchronous process are indicative of an Aircraft operator transmitting a message to DHS and performing other work prior to checking for the DHS response (unblocked mode).

![Figure 1: Synchronous/Asynchronous Processing](image)

**Synchronous Processing**

DHS supports data transmissions requiring request/response processing. Under this form of processing, the aircraft operator’s method that starts a task will wait for a response from DHS. Synchronous processing should be considered when submitting real-time queries (e.g., APIS Quick Query (AQQ))

Synchronous data transport layer supported include:

- IATA host-to-host
- Websphere MQ
- eAPIS web service
Asynchronous Processing

Current data transmissions through ARINC and SITA are Type “B” messages, or asynchronous in nature for one-way conversations. DHS will continue to support this type of message. When used by the aircraft operator, DHS shall respond using a Type “B” message. The Teletype address of the sender will be used in determining who should receive the reply.

Under this form of process, the aircraft operator’s method that starts a task is returned immediately without waiting for a reply from DHS. The aircraft operator’s application can continue to do other work while the task is completed by DHS. Asynchronous processing should be used when submitting batch manifests and Flight Close-Out messages.

Asynchronous data transport layer supported include:

- Websphere MQ
- ARINC Type “B” messages
- SITA Type “B” messages
- eAPIS Web service
1.11 Synchronous Processing using Websphere MQ

Websphere MQ can effectively support synchronous processing. A single application could control both the sending and retrieval of messages. The message Correlation Identifier within the MQ message header can be used to manage the synchronous sending and retrieval of messages. The application would perform an MQPUT with Correlation Identifier assigned by the carrier application and immediately perform a MQGET using the same Correlation Identifier with a WAIT option. This will place the application into a wait state for a defined period of time while the request is processed and a response returned.

![Diagram of synchronous processing using Websphere MQ]

Figure 2: Synchronous Processing with Websphere MQ

The following should be considered when designing a synchronous application using Websphere MQ:

- Use of the Correlation Identifier on the MQ Message Descriptor (MD) header.
- Perform MQPUT with the following options:
  - Priority Option
    Websphere MQ provides for setting a priority from 0 (default) to 9, where 9 is the highest priority. Aircraft operators can use the Priority Option to manage which messages will be serviced first by DHS. For example, Internet check-ins, kiosk check-ins and counter check-ins can each be given separate priority options depending on the carrier’s operational requirements.
  - Perform MQGET with the following option
    - WAIT Option
This option specifies the maximum time (in milliseconds) that the MQGET will wait for a message to arrive on a queue. The WAIT Option is essential in designing synchronous processing using Websphere MQ. The application must account for two conditions when waiting for a response:

- The message arrives on time (e.g., within the wait option)
- The time expires and no message is received

The following technical considerations should be applied when developing a synchronous MQ application:

- DHS does not support MQ dynamic request/reply architecture with carriers. A set of MQ queues will be preconfigured for synchronous and asynchronous requests/responses. Any ReplyToQ and ReplyToQmgr settings populated by carriers will not be used/propagated at DHS.
- DHS only supports use of MQ datagram message type.
- The Correlation Identifier (CorrelID) will be maintained and transferred within DHS and present on responses returned to the carrier. If the CorrelID is not set by the carrier, DHS will copy MsgID to CorrelID and provide this value with the response. For asynchronous requests the carrier may choose to ignore CorrelID.
- Accommodate a single message up to 40,000 bytes.
- The synchronous method should be used for Interactive High Priority messaging only.
- The aircraft operator application should issue an MQGET API call against the response queue using the Wait interval Option.
- Aircraft operator application logic should handle timeouts in the event a response is not received from DHS within the assigned wait interval.
1.12 Asynchronous Processing using Websphere MQ

Websphere MQ is ideally suited for asynchronous processing. Separate applications could control the sending and retrieval of messages. Each application applies First-in-First-Out (FIFO) concept of processing data.

DHS supports Websphere MQ for asynchronous processing with the following technical considerations:

- DHS does not support MQ dynamic request/reply architecture (ReplyToQ) with carriers. A set of MQ queues will be preconfigured for synchronous and asynchronous requests/responses. Any ReplyToQ and ReplyToQmgr settings populated by carriers will not be used/propagated at DHS.
- DHS only supports use of MQ datagram message type.
- The Correlation Identifier (CorrelID) will be maintained and transferred within DHS and present on responses to the carrier. If the CorrelID is not set by the carrier DHS will copy MsgID to CorrelID and provide this value with the response. For asynchronous requests the carrier may choose to ignore CorrelID.
1.13 Using Websphere MQ Message Priorities

Websphere MQ provides the ability to programmatically assign a priority value on messages put to a queue. Batch messages sent to DHS and the resulting DHS response can utilize a prioritization scheme. Under this scenario, the sender of the MQ message assigns a message priority to the Priority attribute on the MQ header. The priority value will then be used by DHS to process the batch message in accordance with the set priority of the message. The priority assigned to the message sent to DHS will also appear on the DHS response message returned to the aircraft operator.

*Interactive Priorities*

DHS recommends setting the highest MQ Priority (e.g., 9) on interactive requests.

*Batch Priorities*

DHS will support batch MQ Priority settings, but strongly discourages their use. If used, batch requests should default to a low MQ Priority to mitigate any contention with interactive messages transmitted across the MQ Channel to DHS. Mixing several priority settings randomly will cause unnecessary overhead on MQ and is not recommended.

Three levels of priority may be employed at the discretion of the aircraft operator:

- **Low:** Initial 72 hour batch submissions and updated submissions occurring between 72 and 48 hours pre-departure.
  
  No MQ Priority setting

- **Medium:** New submission or updated submissions occurring between 48 and 24 hours pre-departure
  
  MQ Priority setting of “5”

- **High:** New submissions or updated submissions occurring with-in 24 hours of departure
  
  MQ Priority setting of “7”

2.6 Master Crew List (MCL) Data for International Only

This data is to be reported for crew or non-crew members arriving at or departing from any U.S. airport, continuing within the U.S., or overflying U.S. territory. This is in addition to the control segments and data elements described in section 2.1.

- A “crew member” is defined as a pilot, copilot, flight engineer, airline management personnel authorized to travel in the cockpit, cabin crew, or relief crew member.
- A “non-crew” member is defined as an air carrier employee or family member, or person traveling onboard a commercial aircraft for the safety of the flight (e.g. an animal handler). Note the non-crew definition only applies to all-cargo flights – these travelers will be considered as “passengers” on passenger or mixed passenger / cargo flights.

2.7 International Arrival Data – Crew and “Non-crew” Flight Manifests

This data is to be reported for crew members and “non-crew” travelers on:

- arriving flights,
- domestic continuance segments of passenger and cargo flights arriving in the U.S., and
- overflights over U.S. territory.

This is in addition to the control segments and data elements described in section 2.1.

- A “crew member” is defined as a pilot, copilot, flight engineer, airline management personnel authorized to travel in the cockpit, or cabin crew, or relief crew member.
- A “non-crew” member is defined as an air carrier employee or family member, or person traveling onboard a commercial aircraft for the safety of the flight (e.g. an animal handler). Note that the non-crew definition only applies to all-cargo flights – these travelers will be considered as “passengers” on passenger or mixed passenger / cargo flights.

2.8 International Departure Data – Crew and “Non-crew” Flight Manifests

This data is to be reported for crew members and “non-crew” travelers on departing passenger and cargo flights (including departing domestic continuance flights). This is in addition to the control segments and data elements described in section 2.1.

- A “crew member” is defined as a pilot, copilot, flight engineer, airline management personnel authorized to travel in the cockpit, or cabin crew, or relief crew member.
- A “non-crew” member is defined as an air carrier employee or family member, or person traveling onboard a commercial aircraft for the safety of the flight (e.g. an animal handler). Note that the non-crew definition only applies to all-cargo flights – these travelers will be considered as “passengers” on passenger or mixed passenger / cargo flights.

Notes:
1. “MRZ” column indicates whether the document has a machine-readable zone. **Older versions of some documents that have not yet expired might not have an MRZ.**
2. “Type Code” column indicates the code that should be transmitted to APIS to identify the type of document. This is sent in the Group 5 “DOC” segment, data element 1001.
3. “Doc Nbr” column indicates whether a Document Number must be transmitted to APIS. This is sent in the Group 5 “DOC” segment, data element 1004.
4. “Issuing Country” column indicates whether a Document Issuing Country is transmitted. In some cases, a specific value is required. This is sent in the Group 5 “LOC” segment with Qualifier Code “91”, in data element 3225, following the related “DOC” segment. APIS regulations indicate passport is the only document that requires country of issuance submission.
5. “Expire Date” column indicates whether a Document Expiration Date must be transmitted to APIS. This is sent in the Group 5 “DTM” segment with Qualifier Code “36”, in data element 2380, following the related “DOC” segment.
6. “Report On” column indicates which type(s) of manifests or MCL the document may be transmitted on.
   - FPM – Flight Passenger Manifest
   - FCM – Flight Crew Manifest
• MCL – Master Crew / Non-crew List.

7. “Comments” include any other factors affecting reporting of the document.

4. Message Structure Keys

The PAXLST & CUSRES transmissions observe a standard set of syntax rules. This section describes the rules as generally used in this document, but it is not a substitute for a complete understanding of the UN/EDIFACT standard. DHS shall observe and enforce the following syntax rules:

- A transmitted message to DHS may include only one instance of a PAXLST message. Batching of multiple PAXLST messages into a single envelope (UNB-UNZ) or batching of multiple envelopes containing PAXLST messages into a single message transmission will result in a rejection of the message(s).

- All message data is in UPPERCASE text.

- The message is divided into segments. UNH, BGM, NAD, etc. are Segment Tags.

- The UNA segment defines special characters used to separate data elements and to terminate the segment. All examples in this document use the default UNA characters. If the UNA segment is not provided in the transmission, it will be assumed the default delimitation characters are used.

The defaults are applied as follows:

- Elements may have sub-elements. To separate sub-elements, use a colon (::).
- (If trailing conditional sub-elements are not present at the end of a data element, their separators are not transmitted.) Segments are divided into Data Elements. To separate Data Elements, use a plus sign (+).
- (If trailing conditional elements are not present at the end of a segment, their separators are not transmitted.)
- A period (.) is to be used to identify decimal point notation.
- A question mark (?) is to be used to release a character, used in the UNA segment, so that it may be recognized in its normal usage. (i.e. O?NEILL would equal O'NEILL).
- A space ( ) is currently held for future use.
- To end a segment, use a single quote (') as the segment terminator.

A different set of control characters may be specified by using the UNA segment.

- Messages must be transmitted as a continuous bit stream. "Lines" have no meaning; there is no such thing as a "maximum" or "minimum" segment length, other than that specified in the segment definitions. (For clarity, sample messages in this guide are shown with a line break between segments. This is completely arbitrary and these "lines" could be shown just as well with a partial segment or more than one segment. Refer to the example in Appendix B.1 for a different view of a PAXLST message.)
• Some telecommunications transmission protocols require various communication type headers and trailers to facilitate addressing, routing, security, and other purposes. The UN/EDIFACT standard does not support this data, and none of the examples in this guide illustrate such. The header and trailer segments that are shown (e.g., UNB, UNH, and UNT) are part of the true EDIFACT transaction. If a value-added network such as SITA or ARINC is used for transmissions, their requirements for additional headers and trailers must be followed.

• The box identified in Figure 4 below describes a specific Data Element. This style of element representation is used throughout this document.

![Figure 4: Data Element Format Diagram – Key](image)

The following Sections (5, 6, 7, 8, 9, 10) identify the syntax rules and the message architecture that must be adhered to when transmitting a PAXLST message. The syntax rules for the CUSRES message set are also provided. These rules reflect the requirements of DHS. In comparison to the WCO/IATA/ICAO PAXLST, some PAXLST data elements are not used. DHS has identified some data elements to be shorter than identified in PAXLST. Some data elements are identified in PAXLST as conditional, however due to DHS regulations, these fields may be considered mandatory. To fulfill regulations, DHS has extended the approved PAXLST segments and data elements, due to specific agency regulations.
5. PAXLST Message Structure

Figure 5 below identifies the basic diagram presentation key used in this document.

![Figure 5: PAXLST Message Architecture Diagram Key](image)

Figure 6 on the following page illustrates the message architecture and relationships between the PAXLST Segment Groups and Segments. The UN/EDIFACT PAXLST message format hierarchy consists of four (4) segment levels and five (5) segment groups of information as depicted in the diagram below.

**Figure 6 : PAXLST Message Architecture Diagram**
Please note the following characteristics:

- The Mandatory and Conditional (optional) requirement designations within the branch diagram conform to the UN/EDIFACT syntax specification for PAXLST. In the technical specifications sections that follow, many of the segments identified as conditional in the branch diagram may be identified as mandatory for the DHS PAXLST implementation. Such requirement designations will be identified for each of the specific segments in the technical specifications that follow in this document.

- Similarly, DHS business rules may require that certain data elements defined as conditional within the UN/EDIFACT PAXLST are required for this implementation. The requirements for the data elements are also identified in the technical specifications that follow in this document.

- The technical specifications also identify the required maximum allowable occurrences for many repeatable segment groups and segments in order to satisfy the DHS implementation requirements. In most cases, DHS requires collection of less data than the maximum allowable by the UN/EDIFACT syntax.

- A single PAXLST may contain vetting requests for up to 999 passengers. PAXLST message containing more than 10 passengers directed to the DHS AQQ interface will not be replied to within 4 seconds. PAXLST messages directed to the DHS AQQ interface containing more than 99 names will result in an error message returned to the sending carrier.

- There are five (5) Segment Groups, shown as GR.1 through GR.5. Note: A Group can be subordinate to another Group in the PAXLST. For example, Group 3 exists only if Group 2 is present. Both are mandatory for this implementation.

- One PAXLST message will be used to report passengers on a specific flight or for an itinerary that contains multiple flights. All passengers identified on a PAXLST message share the same reported itinerary. A separate PAXLST must be used to report crew member information. Separate PAXLST messages may also be sent to report replacement records for travelers previously added to the manifest. The various types of PAXLST messages must be transmitted separately as individual transmissions.

- Sender and Receiver ID qualifiers on the UNB segment are optional for this implementation.

- Sender and Receiver ID qualifiers on the UNG segment are not supported for this implementation.

- The Receiver ID on PAXLST messages reporting Crew/Non-Crew information to APIS must contain ‘USCSAPIS’ in the UNB and UNG segments for proper processing in APIS.
Sample PAXLST Message

Below is a sample PAXLST message in UN/EDIFACT format for a passenger manifest, with one line per segment. (Some segments and data elements that are only used for crew manifests or MCLs are not shown.)

6. PAXLST Segment Examples

This section identifies each segment utilized within the UN/EDIFACT PAXLST message set. The syntax and business rules governing the requirements for the segments follow each of the segment labels. The syntax and business rules governing the requirements for the elements are identified in the gray note box immediately following each element.

The ‘Sample Images’ provide an example of the specific segment usage. The information highlighted in blue in the examples is used to identify placement of the variable Aircraft Operator business data within the context of the segments/elements.

6.1 Service String Advice (UNA)

Segment: UNA Service String Advice

Group: 0
Level: 0
Usage: Conditional (Optional)
Max Use: 1
Purpose: The service string advice segment shall begin with the upper case characters UNA immediately followed by six characters in the order shown below. The space character shall not be used in any data element. The same character shall not be used in more than one position of the UNA.

Notes: Although the use of the UNA Segment is Optional for this implementation. If the UNA is not sent, the values shown in this example will be used as defaults. The UNA segment is used to set delimitation and character set for the body of the transmission.

6.1.1 UNA Example

6.4 Message Header (UNH)

Segment: **UNH** Message Header

- **Group:** 0
- **Level:** 0
- **Usage:** Mandatory
- **Max Use:** 1
- **Purpose:** A service segment starting and uniquely identifying a message. The message type code for the Passenger list message is PAXLST.
  
  Note: Passenger list messages conforming to this document must contain the following data in segment UNH, composite S009:
  
  - Data element 0065 PAXLST 0052 D 0054 05B 0051 UN

**Notes:** This is a mandatory segment for this implementation.

6.4.1 UNH Example

```
UNH + 0062M an..14 PAX001 + 0065M an..6 PAXLST 0052M an 1 D

<td></td>
<td></td>
</tr>
</tbody>
</table>
0073 First/last sequence message transfer indication    C    a1
Indication used for the first and last message in a sequence of the same
type of message relating to the same topic.
The use of this data element is Optional.
A value of 'C' indicates this transmission is a continuance of previously
transmitted data for a particular flight.
A value of 'F' must be used to indicate a FINAL transmission of
passenger/crew data reporting.
Messages reporting FINAL information must contain information
regarding least one crew member or passenger.
6.5 **Beginning of Message (BGM)**

**Segment:** BGM Beginning of Message

- **Group:** BGM
- **Level:** 0
- **Usage:** Mandatory
- **Max Use:** 1
- **Purpose:** A segment to indicate the type and function of the message.
- **Notes:** This segment is mandatory.

The BGM Segment is used to determine the nature of the transaction as it applies to Passenger information reporting, Flight Reporting, or Crew reporting.

If a duplicate transmission is received for a passenger or crew who was previously reported and cleared for the flight, DHS will use the data supplied in the duplicate message to replace the previous version. If a full replacement is sent, all required data elements must be sent with the new transmission.

**6.5.1 BGM Example**

```
BGM 1001M an..3 745
  Document Name Code

BGM 1004C an..35 CP
  Document Identifier
```

**6.5.2 BGM Element Definitions**

**Sample Images and Usage Guidelines**

- **BGM+745’** - Clear Passenger Request (Message type used to identify new passengers to DHS or to obtain updated ESTA status)
- **BGM+745+CP’** - Change Passenger Data (Message type may also be used to obtain updated ESTA status)
- **BGM+745+XR’** - Cancel Reservation/PNR
- **BGM+745+RP’** - Reduction in Party
- **BGM+266+CLNB’** - Flight Close-Out – Identifies Passengers Not Boarded (AQQ – International Flight reporting only)
- **BGM+266+CLOB’** - Flight Close-Out - Identifies Passengers On Board (AQQ – International Flight reporting only)
BGM+266+CL'  - Flight Close-Out only
(AQQ – International Flight reporting **only**)

BGM+266+XF'  - Cancel Flight

BGM+266+CF'  - Change Flight / Itinerary Information (Secure Flight **only**)

BGM+655'  - Gate Pass Request (Secure Flight **only**)

BGM+250'  - Flight Crew List
(See data element summary for additional value examples)

BGM+250+CC'  - Flight Crew Change

BGM+336'  - Master Crew List

| C106         |                   | **DOCUMENT/MESSAGE IDENTIFICATION** |            |
|              |                   | Identification of a document/message by its number and eventually its version or revision. |
| 1004         |                   | **Document identifier**         | C, an..3   |
|              |                   | To identify a document. |
|              |                   | This data element is NOT used for standard clear passenger requests, nor used for Gate Pass issuance clearance requests. |

For reporting changes to Passenger information previously reported to DHS, (**Document Name Code = 745**), the below values may be used in this data element:

CP - Change Passenger Data
XR - Cancel Reservation
RP - Reduction in Party (Delete Passenger on PNR)

For reporting Flight Close-Out or changes to Flight information previously reported to DHS, (**Document Name Code = 266**), the below values may be used in this data element:

CLNB - Flight Close-Out – reporting No Boards
CLOB - Flight Close-Out – reporting On Boards  
CL - Flight Close out (no passengers reported in message)  
XF - Cancel Flight  
CF - Change of Flight Itinerary (Flight Number, Arrival/Departure times and airport locations)

For reporting Crew Flight Manifests (Document Name Code = 250), the following values may be used:

C - Passenger Flight, Regular Scheduled Crew  
CC - Passenger Flight, Crew Change  
B - Cargo Flight, Regular Scheduled Crew  
BC - Cargo Flight, Crew Change  
A - Overflight, Passenger Flights  
D - Overflight, Cargo Flights  
E - Domestic Continuance, Passenger Flight, Regular Scheduled Crew  
EC - Domestic Continuance, Passenger Flight, Crew Change  
F - Domestic Continuance, Cargo Flight, Regular Scheduled Crew  
FC - Domestic Continuance, Cargo Flight, Crew Change
6.6 Reference (RFF) – Transaction Reference Number

Segment: RFF Reference

- **Group:** 0
- **Level:** 0
- **Usage:** Conditional (Optional)
- **Max Use:** 1
- **Purpose:** A segment to specify message reference.

**Notes:** The use of this segment is Mandatory for Secure Flight. The value sent by the aircraft operator system in data element C506:1153 below will be returned to the aircraft operator CUSRES message to facilitate the reconciliation of the messages exchanged. Additionally, the numeric value in data element C506:1153 may be used to sequence any follow-on messages related to updates applied to the same passenger manifest. This value will also be returned in the CURES response message.

### 6.6.1 RFF Example

```
RFF+TN:BA123456789:::1
```

### 6.6.2 RFF Element Definitions

**Data Element Summary**

<table>

</tbody>
</table>

Sample Image

RFF+TN:BA123456789:::1'
**Optional** The value in this data element represents a Transaction Reference Number (TRN) that may be used by the aircraft operator system to track/reconcile responses from DHS air passenger reporting systems. This value also allows DHS systems to uniquely identify a specific transmission from the Aircraft Operator system. The value in this element will be returned in the DHS response message (CUSRES) within the RFF segment in that message.

DHS will accept up to 25 bytes of data in this data element. The value assigned by the Aircraft Operator may contain alpha and numeric characters, and may include pound sign (#), dash (-), and period (.)

**1060 Revision identifier**

| C | an..3 |

To identify a revision.

**Optional** The numeric value in this data element identifies the sequence of the message as relates to updates applied to the same passenger manifest. The sequence number should be incremented by +1 to reflect the implied revision sequence to the manifest.

DHS will accept up to 3 numeric bytes of data in this data element.
6.7 Name and Address (NAD) – Reporting Party

Segment: **NAD Name and Address**

- **Group:** Segment Group 1 (Name and Address)  Conditional (Optional)
- **Level:** 1
- **Usage:** Mandatory
- **Max Use:** 1
- **Purpose:** A segment to identify the name, address and related function.
- **Notes:** This segment used to identify Point of Contact information regarding the aircraft operating party reporting passenger/crew information to DHS.

6.7.1 NAD Example

```
NAD + MS+++JACKSON'
```

6.8 Communication Contact (COM) – Reporting Party Contact Information

Segment: COM Communication Contact

Group: Segment Group 1 (Name and Address) Conditional (Optional)
Level: 2
Usage: Conditional (Optional)
Max Use: 1
Purpose: A segment to identify communication numbers of departments or persons to whom communication should be directed (e.g. telephone and/or fax number).

Notes: This segment used to identify contact information for the party reporting passenger/crew information to DHS.

6.8.1 COM Example

6.9 Details of Transport (TDT) – Flight Identification

Segment: **TDT** Transport Information

- **Group:** Segment Group 2 (Transport Information)  Mandatory
- **Level:** 1
- **Usage:** Mandatory
- **Max Use:** 10
- **Purpose:** A segment to specify details of transport related to each leg, including means of transport, mode of transport name and/or number of vessel and/or vehicle and/or flight.

**Notes:** The TDT segment is mandatory for this implementation. The segment may be used to report up to 10 specific flights (legs) on an flight itinerary for passengers and crew members. Use the TDT to identify the aircraft operator and flight number relevant to the specific flight. Additionally, the TDT segment is a higher level 'parent' segment to the repeatable Segment Group 3 loop construct (LOC and DTM segments). The LOC and DTM segments identify airport locations and timelines within the itinerary.

**6.9.1 TDT Example**

```
TDT + 20 + UA123 +++ UA'
```

**6.9.2 TDT Element Definitions**

</tr>
</tbody>
</table>
Flight Information. Up to eight (8) characters of data may be transmitted. Formatted as Aircraft Operator code and Flight Number:
- Aircraft Operator Code is in IATA format, either AN2 or AN3
- Flight number up to 4 digits (numeric).

For Gate Pass issuance requests, this data element must contain the IATA/ICAO aircraft operator code.

Aircraft Operator code/flight number.

There are two general types of flight identifier formats:

1. IATA - used by regularly scheduled aircraft operators. Up to seven (7) characters of data are accepted, formatted as aircraft operator code and flight number:
   - Aircraft Operator code is in IATA / ICAO format, either AN2 or AN3
   - Flight number is up to 4 digits numeric
   Note: An aircraft operator's operational suffix should not be sent, as is the current practice in US/EDIFACT formatted messages.

2. Tail Number - sometimes used by charter aircraft operators. DHS strongly encourages these aircraft operators to use a unique flight number system, rather than tail numbers.
   - Registered aircraft tail number, up to 7AN.

--- TSA ---

TSA Regulations require a special flight number format for Master Crew Lists (MCLs):
Format is "cccxxMCL", where:
- ccc" - the IATA Aircraft Operator Code
- "xx" - a sequence number for the date of the list filing, starting at "01" and going up to "99" (i.e. 1st filing on a given day has "01", 2nd has "02", etc. The sequence restarts the next day.)
- "MCL" - literal value

6.10 Place/Location Identification (LOC) – Flight Itinerary

Segment: LOC Place/Location Identification

Group: Segment Group 3 (Place/Location Identification) Conditional (Optional)
Level: 2
Usage: Mandatory
Max Use: 1
Purpose: A segment to specify locations such as place of departure, place of destination, country of ultimate destination, country and/or place of transit, country of transit termination, etc. of a passenger/crew.

Notes: Group 3 header Segment LOC may be used to report up to 10 airport locations that comprise the entire journey of a specific flight.

6.10.1 LOC Example

6.10.2 LOC Element Definitions

Sample Image
LOC+87+YVR'

Data Element Summary

<table>
<thead>
<tr>
<th>Data Element</th>
<th>Component Element</th>
<th>Name</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>3227</td>
<td>Location Function Code Qualifier</td>
<td>LOCATION FUNCTION CODE QUALIFIER</td>
<td>M an..3</td>
</tr>
</tbody>
</table>

Code identifying the function of a location.

Inbound International flights (arriving in the U.S.), use the following values:
- 125 Airport of departure; last non-U.S. airport before the flight arrives in the U.S.
- 87 Airport of initial arrival in the U.S.

Outbound International flights (departing from the U.S.), use the following values:
- 125 Airport of departure; last U.S. airport before the flight leaves the U.S.
- 87 Airport of initial arrival outside U.S. territory
For Domestic US Flight reporting - OR - for reporting of flights beginning and ending within the domain of a foreign country, prior to a continuing flight into the United States:
- 92 Used to identify BOTH the departure and arrival airport locations. The departure location LOC segment should appear first. The arrival location LOC segment should appear second.

For Gate Pass Issuance – Use ‘91’ – Gate Pass issue location.

For reporting Overflights (Crew ONLY) - these are reported with the last foreign airport before entering U.S. airspace and the first foreign airport after leaving U.S. airspace:
- 125 Airport of departure; last foreign airport before the flight enters U.S. airspace
- 87 Airport of arrival; first foreign airport after the flight leaves U.S. airspace

Domestic Continuance flights -
SFR Regulations require reporting of the entire flight itinerary on a domestic continuance flight for any crew members that boarded the flight in the U.S. but were not on the flight when it crossed the U.S. border.

For reporting Master Crew List (MCL) - the following fixed values must be used:
- 1st occurrence LOC, use value ‘188’ - Filing Location
- 2nd occurrence LOC, use value ‘172’ - Reporting Location

C517 LOCATION IDENTIFICATION
Identification of a location by code or name.

3225 Location name code M an..3
Code specifying the name of the location.
Three (3) character IATA Airport Code.
6.11 Date/Time/Period (DTM) – Flight Leg Arrival / Departure

Segment: **DTM** Date/Time/Period

Group: Segment Group 3 (Place/Location Identification)  Conditional (Optional)
Level: 3
Usage: Conditional (Optional)
Max Use: 1
Purpose: A segment to specify associated dates and/or times as required related to locations.

Notes: Each DTM segment must follow the unique parent LOC segment.

Per AFR regulations, only the flight leg that crosses the U.S. border is reported. Only the start and end airports for that leg are needed. Therefore, only the departure date/time for the starting airport and the arrival date/time for the ending airport are needed.

6.11.1 DTM Example

DTM+189:0704291230:201‘

6.11.2 DTM Element Definitions

**Sample Images**

DTM+189:0704291230:201’

<td></td>
<td>The value of a date, a date and time, a time or of a period in a specified representation.</td>
<td></td>
</tr>
</tbody>
</table>
All Dates and Times reported should reflect the local date/time of the Airport to which they refer.

Date/Time value formatted as 'YYMMDDhhmm' where:

YY - Year
MM - Month
DD - Day
hh - Hour
mm - Minutes

2379 Date or time or period format code C an..3

Code specifying the representation of a date, time or period.
Optional for this implementation. If sent, use Value '201' (format code YYMMDDhhmm).
6.12 **Name and Address (NAD) – Traveler Identification**

<table>
<thead>
<tr>
<th>Segment:</th>
<th>NAD Name and Address</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Group:</strong></td>
<td>Segment Group 4 (Name and Address)</td>
</tr>
<tr>
<td><strong>Level:</strong></td>

<tr>
<td><strong>Max Use:</strong></td>
<td>1 (Per NAD Segment Group 4 occurrence)</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>A segment specifying name of the passenger or crew member.</td>
</tr>
<tr>
<td><strong>Notes:</strong></td>
<td>This segment used to begin segment loop containing Passenger or Crew information.</td>
</tr>
</tbody>
</table>

**Name Reporting Requirements**: Full name required for the following scenarios:
- Domestic U.S. Flights
- International Flights (Inbound and Outbound)
- International to International Flights (U.S. aircraft operators only)
- Gate Pass Issuance (U.S. Airports)
- Flight Close-out (identifying booked passengers that did not board the flight)
- Crew (for International flights or Overflights of U.S. territories)

**Name Reporting Rules**:

Last and First Names must be complete. A single character initial should not be used to represent either First or Last name unless it is part of the traveler’s legal name.

Imbedded spaces are allowed in all name fields.

Numeric characters are **not** allowed in name fields.

Special characters are **not** commonly found in the machine readable zone (MRZ) of a travel document and should therefore not be included within the name field. In the event data is collected without the use of a document reader, the use of a hyphen (-) and/or apostrophe (’) are the only special characters allowed within the name field.

Accents or any other diacritical marks should not appear on any character.

Name components should be reported in the same manner as they exist on the ICAO-standard MRZ of the primary travel document.

The following points should be taken into consideration:

1.) An MRZ delimiter of "<<" appearing in the MRZ name part translates into a sub-element separator (":" ) in composite element C080 of the NAD segment.

2.) A "<" translates into a space on the APIS message – do not remove the single "<" and concatenate a two-name component. (i.e., "SMITH<JONES" becomes "SMITH JONES")

3.) For greater accuracy, it is advisable to extract the travel name from the MRZ of the travel document instead of using names found within a reservation/booking. This will eliminate titles (such as "Mr.", "Mrs.", "Dr.", honorific suffixes such as "MD", and embedded hyphens or other punctuation such as "Smith-Corona").
4.) If there is a name suffix, such as "Jr." in "Robert Johnson Jr.", the ICAO standard for MRZ would exclude the name suffix. Therefore, this should be reported as "JOHNSON:ROBERT".

5.) If a name component on the MRZ exceeds the length provided for in this segment definition, DHS will truncate the extra characters for that component.

6.) If a name component has more than one fragment or has embedded punctuation, follow the format of the MRZ.

Some examples:

An MRZ name part of "DOE<<JOHN<WAYNE" should be reported as "DOE:JOHN WAYNE".

If Juan-Jesus Ramirez has a passport with an MRZ of "RAMIREZ<<JUAN<JESUS", report it as "RAMIREZ:JUAN JESUS".

James O'Reilly will appear on the MRZ as "O<REILLY<<JAMES" and should be reported as "O REILLY:JAMES".

If the MRZ identifies James O'Reilly on the MRZ as "OREILLY<<JAMES", the name should be reported as "OREILLY:JAMES".

Marie Hansen-Maher will appear on the MRZ as "HANSEN<MAHER<<MARIE" and should be reported as "HANSEN MAHER:MARIE".

Address Reporting Rules

Address elements (Number/Street, City, State, and Postal Code) are conditional on a number of factors. According to AFR regulations:

U.S. Destination Address is required for all passengers on Inbound flights except:
- U.S. citizens
- Legal permanent residents
- In-transit passengers
- Crew members

If a passenger is joining a ship or is en route to a foreign destination, provisions have been defined to accept a description of the destination as follows: "Transit to Caribbean Princess, Miami, FL, USA, 99999". This is deemed acceptable as long as all fields contain accurate information.

AFR Regulations require Home Address, including Country, for all crew members.

6.14 Date/Time/Period (DTM) – Traveler Date of Birth

Segment: **DTM Date/Time/Period**

**Group:** Segment Group 4 (Name and Address)  Conditional (Optional)
**Level:** 2
**Usage:** Conditional (Optional)
**Max Use:** 1
**Purpose:** A segment to specify date of birth.

**Notes:** One occurrence of the DTM segment to identify Date of Birth of passenger or crew member. The birth date should match the value as scanned from the travel document's machine-readable zone (MRZ), not including any check digit. For example, a passport with DOB of 16 Sep 1956 might have an MRZ field of “5609165”, which should be reported as “DTM+329:560916”.

6.14.1 DTM Example

6.17 Place/Location Identification (LOC) – Residence / Itinerary / Birth

Segment: LOC Place/Location Identification

Group: Segment Group 4 (Name and Address) Conditional (Optional)
Level: 2
Usage: Conditional (Optional)
Max Use: 5
Purpose: A segment indicating country of birth and port/place of origin (embarkation), transit and destination (debarkation) of a passenger and/or crew.
Notes: This LOC segment reports the Traveler's Itinerary.

The LOC segment is used for reporting the following information:
- Airport of first US arrival (Required for Inbound international flights)
- Country of residence (Inbound international flights)
- Port of embarkation
- Port of debarkation
- Place of birth (Crew member reporting only)

Date Element 3227 identifies the specific location information being reported.

Reporting Rules:

Airport of first US arrival into U.S. This information is mandatory for inbound International passenger reporting. Use value ‘22’ in qualifying element 3227. (Note: This information must be reported as a U.S. airport code, regardless of any pre-screening procedures conducted at a non-U.S. airport.)

Country of Residence. This information is mandatory for inbound International passenger reporting. Use value ‘174’ in qualifying element 3227.

Airport of embarkation, known airport where the traveler began journey. Use value ‘178’ in qualifying element 3227.

Airport of debarkation, known airport where the traveler ends journey. Use value ‘179’ in qualifying element 3227.

Place of Birth. This information is mandatory for Crew member reporting. Use value ‘180’ in qualifying element 3227.
6.17.1 LOC Example

```
LOC  +  180
     +  USA

    +  ANYCITY
    +  ANYSTATE
```

6.20 Nationality (NAT) – Traveler Citizenship

Segment: **NAT** Nationality

- **Group:** Segment Group 4 (Name and Address) Conditional (Optional)
- **Level:** 2
- **Usage:** Conditional (Optional)
- **Max Use:** 1
- **Purpose:** A segment to indicate the nationality of a passenger and/or crew.
- **Notes:** This segment used to report Citizenship (Nationality) of a specific traveler.

### 6.20.1 NAT Example

```
NAT+2+CAN'
```

### 6.20.2 NAT Element Definitions

**Sample Image**

NAT+2+CAN'

<table>
<thead>
<tr>
<th>Data Element</th>
<th>Component Element</th>
<th>Name</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>

<tr>
<td>3293</td>
<td>an..3</td>
<td>Nationality name code</td>
<td></td>
</tr>
</tbody>
</table>

- **3493 M an..1**
  - *NATIONALITY CODE QUALIFIER*
  - Code qualifying a nationality.
  - Always '2'

- **C042 M**
  - *NATIONALITY DETAILS*
  - To specify a nationality.

- **3293 an..3**
  - Nationality name code
  - Code specifying the name of a nationality.
  - 3 character ISO 3166 Country Code to reflect country of nationality (citizenship).
• **Reference (RFF) – Traveler Identification**

Segment: **RFF** Reference

- **Group:** Segment Group 4 (Name and Address)         Conditional (Optional)
- **Level:** 2
- **Usage:** Conditional (Optional)
- **Max Use:** 9
- **Purpose:** A segment specifying the number assigned by an aircraft operator that identifies a passenger's reservation.

**Notes:** This RFF segment reports the following information:
- Passenger Name Record Locator
- Aircraft Operator Unique Passenger Reference identifier
- DHS Passenger Redress Number
- DHS Known Traveler Number (Future Use)
- Assigned Seat Number/Identifier

**Notes:**

As required under the Secure Flight Final Rule (Oct 2008), both the Passenger Name Record Locator and the Unique Passenger Reference number must be supplied, when sending interactive data. In the event a PNR locator is not available, the carrier may assign a unique value not to exceed 6 bytes of data.

• **RFF Example**

```
RFF + AVF:ABC123'
RFF+ABO:BA1321654987'
RFF+SEA:22A'
RFF+AEA:1234567890ABC'
RFF+CR:20060907NY123'
```

**6.20.3 RFF Element Definitions**

**Sample Image**

- **RFF+AVF:** ABC123'
- **RFF+ABO:** BA1321654987'
- **RFF+SEA:** 22A'
- **RFF+AEA:** 1234567890ABC'

<td>REFERENCE</td>
<td></td>
</tr>
</tbody>
</table>

Identification of a reference.

<table>
<thead>
<tr>
<th>Reference code qualifier</th>
<th>M</th>
<th>an..3</th>
</tr>
</thead>
</table>

Code qualifying a reference.

Valid values:
- AVF - Passenger Name Record Locator
- ABO - Aircraft Operators Unique Passenger Reference identifier (Originator's reference)
- AEA - DHS Passenger Redress Number (Government agency reference number)
- CR - DHS Known Traveler Number (Customer reference number)
- SEA - Seat Number/Identifier

<table>
<thead>
<tr>
<th>Reference identifier</th>
<th>M</th>
<th>an..25</th>
</tr>
</thead>
</table>

Identifies a reference.

The value provided in this data element will correspond to the meaning as applied by the value contained in DE 1153. The expected characteristics for each data item are as follows:

- Passenger Name Record Locator an..6
- Seat Number/Identifier n3a1
- DHS Passenger Redress Number an..13
- DHS Known Traveler Number an..25
- Aircraft Operators Unique Passenger Reference (UPR) identifier an..25

The value assigned by the Aircraft Operator for the UPR may contain alpha and numeric characters, and contain pound sign (#), dash (-), and period (.)
6.21 Document/Message Details (DOC) – Traveler Document(s)

Segment: DOC Document/Message Details

- **Group:** Segment Group 5 (Document/Message Details)  Conditional (Optional)
- **Level:** 2
- **Usage:** Mandatory
- **Max Use:** 1 (Per DOC Segment Group 5 occurrence)
- **Purpose:** A segment identifying passenger and/or crew travel documents, such as passports, visas etc.
- **Notes:** The DOC segment is the hierarchical parent segment for a group of segments used to report information regarding passenger travel documentation. Travel documentation is not required for U.S. citizens traveling on domestic flights.

A DOC segment may be followed by a DTM and/or LOC segment to provide additional information as relates to the document being reported.

Up to two (2) DOC segments may be sent to DHS on the PAXLST to report passenger or crew travel documents.

**Valid Travel Document Types:**
- Passport
- Permanent resident card
- Resident alien card
- US military ID.
- Re-entry permit or refugee permit
- NEXUS or SENTRI card
- Facilitation document
- U.S. Non-Immigrant Visa (Secondary Document Only)
- Pilots License (crew members only)

**Travel Document reporting rules:**

**Passenger reporting:**
A valid travel document is required for all passengers on international flights to or from the U.S.

**Master Crew List reporting:**
Report the Pilot's license (if applicable) and report Country of Issue in LOC segment.
Report Passport number and expiration information in the DTM segment.

**Arriving/Departing Crew member reporting:**
Report Passport number and pilot's license (where applicable), or if a crew member is other than a pilot, report the permanent resident card if the crew member is a legal permanent resident.
### 6.21.1 DOC Example

```
+ DOC P
  + 1001M an..3

6.23 Place/Location Identification (LOC) – Document Issuing Country

Segment: LOC Place/Location Identification

- **Group:** Segment Group 5 (Document/Message Details)  Conditional (Optional)
- **Level:** 3
- **Usage:** Conditional (Optional)
- **Max Use:** 1
- **Purpose:** A segment indicating the country that issued the document.
- **Notes:** The LOC segment is used to report the country code for the country where the Passport or Pilot’s license (for Crew) was issued.

6.23.1 LOC Example

```
LOC + 91 + CAN
```

6.23.2 LOC Element Definitions

<td></td>
<td>Control total quantity</td>
<td>M n..18</td>
</tr>
<tr>
<td></td>
<td></td>
<td>To specify the value of a control quantity.</td>
<td></td>
</tr>
</tbody>
</table>

- **Value in this element should reflect the following:**
  - For DHS Boarding Pass issuance, the value in this data element must be the total number of travelers included in this transmission.
  - For Flight Close-out transmissions, the value in this data element must reflect the total number passengers or crew members on the flight.
6.25 Message Trailer (UNT)

Segment: **UNT** Message Trailer

- **Group:**
  - **Level:** 0
  - **Usage:** Mandatory
  - **Max Use:** 1
  - **Purpose:** A service segment ending a message, giving the total number of segments in the message (including the UNH & UNT) and the control reference number of the message.
- **Notes:** The UNT segment is mandatory for this implementation.

6.25.1 UNT Example

```
UNT + 35 + PAX001'
```

6.25.2 UNT Element Definitions

**Sample Image**
UNT+35+PAX001’

### Data Element Summary

<table>
<thead>
<tr>
<th>Data Element</th>
<th>Component Element</th>
<th>Name</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>0074</td>
<td>NUMBER OF SEGMENTS IN A MESSAGE</td>
<td>Control count of number of segments in a message.</td>
<td>M n..6</td>
</tr>
<tr>
<td>0062</td>
<td>MESSAGE REFERENCE NUMBER</td>
<td>Unique message reference assigned by the sender.</td>
<td>M an..14</td>
</tr>
</tbody>
</table>

- The value in this data element represents the total number of segments from the UNH segment to the UNT segment inclusive.
- The value in this data element must match the value appearing on data element 0062 on the UNH segment in this same PAXLST message.
6.26 **Group Trailer (UNE)**

Segment: **UNE** Functional Group Trailer

- **Group:** 0
- **Level:** 0
- **Usage:** Conditional
- **Max Use:** 1
- **Purpose:** To end and check the completeness of a Functional Group
- **Notes:** The UNE segment is included only in cases where the PAXLST message contains a Functional Group Header (UNG) segment.

### 6.26.1 UNE Example

```
0060M n..6
UNE + 1
0048M an..14
  + 100
   
```

**Group Control Count** 1

**Group Reference Number** 100

### 6.26.2 UNE Element Definitions

#### Sample Image

<table>
<thead>
<tr>
<th>Data Element</th>
<th>Component Element</th>
<th>Name</th>
<th>Attributes</th>
<th>Attributes Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>0060</td>
<td></td>
<td>NUMBER OF MESSAGES</td>
<td>M</td>
<td>n..6</td>
</tr>
<tr>
<td></td>
<td></td>
<td>A count of the number of messages in a functional group. The value in this data element represents the number of messages included in the group.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0048</td>
<td></td>
<td>FUNCTIONAL GROUP REFERENCE NUMBER</td>
<td>M</td>
<td>an..14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Reference number for the functional group assigned by and unique within the sender's division, department etc. The value in this data element must match the value appearing on data element 0048 on the UNG segment in this same PAXLST message.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
6.27 Interchange Trailer (UNZ)

Segment: **UNZ** Interchange Trailer

- **Group:** 0
- **Level:** 0
- **Usage:** Mandatory
- **Max Use:** 1
- **Purpose:** To end and check the completeness of an interchange
- **Notes:** The UNZ segment is mandatory for this implementation.

### 6.27.1 UNZ Example

```
UNZ+1+000000001'
```

### 6.27.2 UNZ Element Definitions

#### Sample Image

UNZ+1+000000001'

<table>
<thead>
<tr>
<th>Data Element</th>
<th>Component Element</th>
<th>Name</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>0036</td>
<td></td>
<td>INTERCHANGE CONTROL COUNT</td>
<td>M n..6</td>
</tr>
<tr>
<td>0020</td>
<td></td>
<td>INTERCHANGE CONTROL REFERENCE</td>
<td>M an..14</td>
</tr>
</tbody>
</table>

- **INTERCHANGE CONTROL COUNT**: Count either of the number of messages or, if used, of the number of functional groups in an interchange. The value in this data element represents the number of groups included in this interchange (transmission).
- **INTERCHANGE CONTROL REFERENCE**: Unique reference assigned by the sender to an interchange. The value in this data element must match the value appearing on data element 0020 on the UNB segment in this same PAXLST message.
7. DHS CUSRES Response Message

The CUSRES message is used in this implementation to communicate the following information to the aircraft operator:

1. DHS response to PAXLST messages received from aircraft operator that reported passenger, reservation, or flight details;
2. DHS unsolicited message generated by DHS as result of changes to the status of a previously vetted passenger.

Figure 7 below identifies the basic diagram presentation key used in this document.

Figure 7: CUSRES Message Architecture Diagram Key

<table>
<thead>
<tr>
<th>Segment Group 4</th>
<th>C</th>
<th>99</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERP</td>
<td>M</td>
<td>1</td>
</tr>
<tr>
<td>RFF</td>
<td>C</td>
<td>9</td>
</tr>
<tr>
<td>ERC</td>
<td>C</td>
<td>1</td>
</tr>
<tr>
<td>FTX</td>
<td>C</td>
<td>1</td>
</tr>
</tbody>
</table>

Figure 8 on the following page illustrates the message architecture and relationships between the CUSRES Segment Groups. The UN/EDIFACT CUSRES message format hierarchy consists of THREE (3) segment levels and TWO (2) segment groups of information as depicted in Figure 7.
Segment ID | Segment ID | Segment Requirement | Maximum Segment Occurs | Maximum Group Occurs
---|---|---|---|---
UNA | Service Segment Advice | C | 1 |
UNB | Interchange Header | M | 1 |
UNG | Functional Group Header | C | 1 |
UNH | Message Header | M | 1 |
BGM | Beginning of Message | M | 1 |

| Segment Group 3 | C | 11 |
RFF | Reference | M | 1 |
DTM | Date/Time/Period | C | 2 |
LOC | Place/Location Identification | C | 2 |

| Segment Group 4 | C | 999 |
ERP | Error Point Details | M | 1 |
RFF | Reference | C | 9 |
ERC | Application Error Information | C | 1 |
FTX | Free Text | C | 1 |
UNT | Message Trailer | M | 1 |
UNE | Functional Group Trailer | C | 1 |
UNZ | Interchange Trailer | M | 1 |

**Figure 8: CUSRES Message Architecture Diagram**

Please note the following characteristics:

- The Mandatory and Conditional (optional) requirement designations within the branch diagram conform to the UN/EDIFACT syntax specification for the CUSRES. In the technical specifications sections that follow, many of the segments identified as conditional in the branch diagram may be identified as mandatory for the DHS CUSRES implementation. Such requirement designations will be identified for each of the specific segments in the technical specifications that follow in this document.

- Similarly, DHS business rules may require that certain data elements defined as conditional within the UN/EDIFACT CUSRES are required for this implementation. The requirements for the data elements are also identified in the technical specifications that follow in this document.

- The technical specifications also identify the required maximum allowable occurrences for many repeatable segment groups and segments in order to satisfy the DHS implementation requirements. In most cases, DHS requires collection of less data than the maximum allowable by the UN/EDIFACT syntax.
• One CUSRES message will be sent to the aircraft operator, in response to each PAXLST message received from the aircraft operator.

Sample CUSRES Message

This is a sample CUSRES message in UN/EDIFACT format for a passenger manifest, with one line per segment.

Figure 9: Basic Sample UN/EDIFACT CUSRES Message
8. DHS CUSRES Segment Examples

This section identifies each segment utilized within the UN/EDIFACT CUSRES message set.

In this specification, the syntax and business rules governing the requirements for the segments follow each of the segment labels. The syntax and business rules governing the requirements for the elements are identified in the gray note box immediately following each element.

The ‘Sample Images’ provide an example of the specific segment usage. The information highlighted in blue in the segment examples is for illustration purposes only and is intended to identify the placement of the sample data received from the aircraft operator and appear on the resultant CUSRES response message from DHS.

8.1 Service String Advice (UNA)

Segment: UNA Service String Advice

Group:  
Level: 0
Usage: Conditional (Optional)
Max Use: 1
Purpose: The service string advice segment shall begin with the upper case characters UNA immediately followed by six characters in the order shown below. The same character shall not be used in more than one position of the UNA.

Notes: The UNA segment is used to set delimitation and character set for the body of the transmission.

Although the use of the UNA Segment is Optional for this implementation. it may be sent on this message if the aircraft operator specifically requests DHS send it.
8.1.1 UNA Example

<table>
<thead>
<tr>
<th>UNA</th>
<th>Sub-element separator</th>
</tr>
</thead>
<tbody>
<tr>
<td>:</td>
<td>(colon)</td>
</tr>
<tr>
<td>+</td>
<td>(plus sign)</td>
</tr>
<tr>
<td>.</td>
<td>(period)</td>
</tr>
</tbody>
</table>

8.1.2 UNA Element Definitions

Sample Image
UNA:+.? ’

<table>
<thead>
<tr>
<th>Req. Designate</th>
<th>Data Element</th>
<th>Component Element</th>
<th>Name</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNA1</td>
<td>COMPONENT DATA ELEMENT SEPARATOR</td>
<td></td>
<td></td>
<td>M an1</td>
</tr>
<tr>
<td></td>
<td>Default value ‘:’ (colon)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Usage: To separate component (sub-) elements within a Composite data element.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>UNA2</td>
<td>DATA ELEMENT SEPARATOR</td>
<td></td>
<td></td>
<td>M an1</td>
</tr>
<tr>
<td></td>
<td>Default value ‘+’ (plus sign)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Usage: To separate data elements.</td>

8.3 Group Header (UNG)

Segment: **UNG** Functional Group Header

- **Group:**
  - **Level:** 0
  - **Usage:** Conditional
  - **Max Use:** 1
  - **Purpose:** To begin a group of like transaction. Only one grouping of transactions will be allowed for this implementation.

**Notes:** The UNG segment will appear on the CUSRES response message if sent on the associated PAXLST message.

8.3.1 UNG Example:

```
UNG +
  0038M an..6 CUSRES
  Message Group Identification
  +
  0040M an..35 USADHS
  Application Sender Identification
  +
  0044M an..35 XYZ AIRLINES
  Application Recipient Identification

<td></td>
</tr>
</tbody>
</table>
8.4 Message Header (UNH)

Segment: **UNH** Message Header

- **Group:**
  - **Level:** 0
  - **Usage:** Mandatory
  - **Max Use:** 1
  - **Purpose:** A service segment starting and uniquely identifying a message. The message type code for the Customs response message is CUSRES.

Note: Customs response messages conforming to this document must contain the following data in segment UNH, composite S009:
Data element 0065 CUSRES 0052 D 0054 05B 0051 UN

**Notes:** This is a mandatory segment for this implementation.

8.4.1 UNH Example:

```
UNH +
  0062M an..14
    DHS0001
      Message Reference Number

  +
  0054M an..3
    05B
      Message Type Release Number

  +

</tbody>
</table>
8.6 Reference (RFF) – Transaction Reference Number / Flight Identification

Segment: RFF Reference

Group: Segment Group 3 (Reference)
Level: 1
Usage: Conditional (Optional)
Max Use: 11
Purpose: A segment to specify message reference.

Notes: The RFF segment loop may repeat up to 11 times and serves two purposes:

1. Identify the Transaction Reference Number (TRN) that appeared on the input PAXLST message along with the message sequence number, and;

2. Identify the flight departure and arrival information reported on the input passenger manifest PAXLST message sent to DHS by the aircraft operator.

The first occurrence of the RFF segment will identify the TRN if reported on the PAXLST from the aircraft operator. The returned TRN provides the aircraft operator the ability to use their uniquely assigned number to reconcile and associate the passenger manifest message to this DHS response message.

Subsequent RFF segments will identify the flight number as reported on the PAXLST from the aircraft operator. The RFF segment will be followed by DTM and LOC segments, where applicable, to identify departure and arrival locations and times, as reported on the PAXLST from the aircraft operator.

One RFF Segment loop will be returned for each flight leg of a contiguous continuing flight. Each flight responded to will be returned in the order in which they were received by DHS.

For DHS Unsolicited Messages, please note:
The Transaction Reference Number will be assigned by DHS the system. The aircraft operator must return the image of the CUSRES as an acknowledgement to DHS and include the same TRN number in the message, for all Unsolicited Messages.
### 8.6.1 RFF Example

```
RFF +

Reference Code Qualifier

1153M 3

TN

1154M 25

UA123456789

Reference identifier

1060M 3

001

Revision Identifier
```

<th>Data Element</th>
<th>Component Element</th>
<th>Name</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>3227</td>
<td>LOCATION FUNCTION CODE QUALIFIER</td>
<td>Man..3</td>
<td>M an..3</td>
</tr>
</tbody>
</table>

Code identifying the function of a location.

The value reported in this DE will contain the value as reported on the PAXLST message sent to DHS.

Values contain below meanings:

Inbound International flights (arriving in the U.S.) :
- 125 Airport of departure; last non-U.S. airport before the flight arrives in the U.S.
- 87 Airport of initial arrival in the U.S.

Outbound International flights (departing from the U.S.) :
- 125  Airport of departure; last U.S. airport before the flight leaves the U.S.
- 87   Airport of initial arrival outside U.S. territory

For Domestic Flights - OR - for flights beginning and ending within the domain of a foreign country:
- 92   Identifies BOTH the departure and arrival airport locations. The departure location LOC segment appears first. The arrival location LOC segment appears second.

For reporting Overflights - these report the last foreign airport before entering U.S. airspace and the first foreign airport after leaving U.S. airspace:

For Crew Reporting:
- 125  Airport of departure; last foreign airport before the flight enters U.S. airspace
- 87   Airport of arrival; first foreign airport after the flight leaves U.S. airspace

C517  LOCATION IDENTIFICATION
Identification of a location by code or name.

3225  Location name code
M an..3
Code specifying the name of the location.
Three (3) character IATA Airport Code.
8.9 Error Point Detail (ERP) – Heading/Detail Loop Segment

Segment: ERP Error Point Details

Group: Segment Group 4 (Error Point Details) Conditional (Optional)
Level: 1
Usage: Mandatory
Max Use: 999
Purpose: A segment identifying the location of an application error within the referenced message.
Notes: The ERP segment group 4 serves two functions:

1.) Header Segment for reporting DHS General Responses to changes in flights, reservations and close-outs.

2.) Detail Segment Loop Header for reporting passenger status information.

One ERP Segment Loop will be returned on the DHS Response CUSRES message for each passenger reported on the PAXLST sent to DHS by the aircraft operator.

8.9.1 ERP Example

```

8.10 Reference (RFF) – Traveler Identification

Segment: **RFF** Reference

- **Group:** Segment Group 4 (Error Point Details)  Conditional (Optional)
- **Level:** 2
- **Usage:** Conditional (Optional)
- **Max Use:** 9
- **Purpose:** A segment to provide the references related to the application error.
- **Notes:** This RFF segment is used to identify the passenger. If the aircraft operator identifies a passenger using multiple RFF segments, DHS will respond with the multiple RFF segments. Note: This segment is not used for DHS General Response messages.

8.10.1 RFF Example

```
RFF + 1153M an..3 AVF  1154M an..25 ABC123

8.11 Application Response Code (ERC) – Status Code

Segment: **ERC** Application Error Information

**Group:** Segment Group 4 (Error Point Details)  Conditional (Optional)

**Level:** 2

**Usage:** Conditional (Optional)

**Max Use:** 1

**Purpose:** A segment identifying the type of application errors within a message.

**Notes:**

Status of passenger in response to aircraft operator clear passenger request;

New status of passenger as result of changes to DHS watch list for passenger;

ESTA status result;

Response to changes in flights, reservations, or flight close-out messages.

Errors identified in the Itinerary or message structure.

8.11.1 ERC Example

9. Aircraft Operator Response CUSRES Message Structure

This section identifies the segments utilized within the UN/EDIFACT CUSRES message that must be generated by the aircraft operator and returned to DHS to acknowledge receipt of a DHS Unsolicited Message.

The specific requirements for this acknowledgement CUSRES message will be virtually identical to the format of the CUSRES DHS Unsolicited Message with the following modifications:

1. The Sender and Receiver identities on the UNB and UNG segments must be switched to convey the accurate directional exchange of the message;

2. The FTX segment will need to be included in the CUSRES message to reflect the actual status of the boarding pass issuance by the aircraft operator (refer to the FTX segment specification in this document).

In this specification, the syntax and business rules governing the requirements for the segments follow each of the segment labels. The syntax and business rules governing the requirements for the elements are identified in the gray note box immediately following each element.

The ‘Sample Images’ provide an example of the specific segment usage. The information highlighted in blue in the segment examples is for illustration purposes only and is intended to identify the placement of the sample data received from the aircraft operator and appear on the resultant CUSRES response message from DHS.

**Figure 11: Aircraft Operator CUSRES Message Architecture Diagram**

Please note the following characteristics:

- The Mandatory and Conditional (optional) requirement designations within the branch diagram conform to the UN/EDIFACT syntax specification for the CUSRES. In the technical specifications sections that follow, many of the segments identified as conditional in the branch diagram may be identified as mandatory for the DHS CUSRES implementation. Such requirement designations will be identified for each of the specific segments in the technical specifications in this document.
- Similarly, DHS business rules may require that certain data elements defined as conditional within the UN/EDIFACT CUSRES are required for this implementation. The requirements for the data elements are also identified in the technical specifications in this document.
- The technical specifications also identify the required maximum allowable occurrences for many repeatable segment groups and segments in order to satisfy the DHS implementation requirements. In most cases, DHS requires collection of less data than the maximum allowable by the UN/EDIFACT syntax.
- One CUSRES message will be sent to the aircraft operator in each transmission, in response to each PAXLST message received from the aircraft operator.
10. Aircraft Operator CUSRES Segment Examples

10.1 Service String Advice (UNA)

Segment: UNA Service String Advice

Group: 0
Level: 0
Usage: Conditional (Optional)
Max Use: 1
Purpose: The service string advice segment shall begin with the upper case characters UNA immediately followed by six characters in the order shown below. The same character shall not be used in more than one position of the UNA.

Notes: The UNA segment is used to set delimitation and character set for the body of the transmission.

10.1.1 UNA Example

```
UNA:+.? '
```

Appendices
Appendix A. Segment Group Coding Rules – Passenger Manifests

Segment Groups were described in Section 3 “Message Structure,” and many of the individual segments defined above are contained in one of the groups. The importance of segment groups is that they are a set of related segments that work together to report an important business entity. To do this properly, many of the groups have coding rules that provide the context for the rules of individual segments. This appendix describes the PAXLST segment groups and their rules in detail.

Note: TSA regulations require different coding for some segment groups for Master Crew Lists and crew member manifests. Some of those exceptions are described in this appendix. Also, refer to Appendix “G” for MCL and crew manifest coding rules that differ from the passenger manifest rules stated in this appendix.

A.1. Group 1 – Reporting Party

This group describes the party responsible for the data being reported. DHS will contact this party if any problems are found with the transmission. It is an optional group, but DHS expects that all filers will provide accurate data with the transmission, and/or maintain current information on DHS point-of-contact database.

A.2. Group 2 – Flight Identification

This group is mandatory and consists of at least one TDT segment loop header that identifies the carrier and flight number. If this segment is missing or invalid, the message will be discarded. The TDT segment loop header must be repeated for each flight leg.

Note: For Crew manifests, TSA regulations require an added suffix to the flight number to specify the type of flight being reported – refer to section G.1.2. Also, Master Crew Lists have specific requirements for reporting a “flight” ID – refer to section G.1.3.

A.3. Group 3 – Flight Itinerary

There are some important differences in Group 3 coding between: (a) passenger manifests, (b) crew member manifests, and (c) Master Crew Lists. This section applies only to passenger manifests. Crew member manifests are described in Appendix G.1.2. Master Crew List coding rules are described in Appendix G.1.3.

This group is subordinate to Group 2. Segment Group 3 utilizes a repeating LOC-DTM segment loop that repeats up to 2 times to report Departure Airport (1st LOC), Departure Time (1st DTM), Arrival Airport (2nd LOC), and Arrival Time (2nd DTM). Times must be reported in local times.
Notes:
(1) APIS regulations will only require the flight leg crossing the U.S. border to be reported for normal passenger manifests. However, a crew manifest reporting “domestic continuance” may require additional U.S. flight legs to be reported.
(2) Secure Flight regulations require the reporting of the traveler’s complete, single direction travel. This will necessitate the submission of multiple TDT, and subordinate LOC/DTM segment loops.
(3) Crew member manifest rules are different, due to TSA requirements for reporting crew changes on flight legs within the U.S. Refer to Appendix G.1.2.

1. Maximum and minimum number of LOC – DTM loops:
   - Only two LOC-DTM loops are expected. These loops report the Departure airport (LOC+125 segment) and Arrival airport (LOC+87 segment). (Note: “125” and “87” are the Location Function Code Qualifiers for departure and arrival, respectively.) These are:
     - For International Inbound flights, the port of last foreign departure (LOC+125) and the first port of U.S. arrival (LOC+87).
     - For International Outbound flights, the port of last U.S. departure (LOC+125) and the first port of foreign arrival (LOC+87).
     - For messages having multiple flight segments prior to a US arrival or after a US departure, the (LOC+92) segment loop should be used.
     - For purely domestic transmissions, the (LOC+92) segment loop should be used.

2. “Progressive”, Pre-clearance, Final Destination, and In-Transit airports:
   - “Pre-clearance” of international inbound travelers is done at specific foreign airports prior to the flight’s departure for entry into the U.S. (for example, in Montreal for a flight to New York). These flights must be reported to APIS, with the foreign port (e.g., Montreal) as the Departure location and the U.S. port (e.g., New York) as the Arrival location.
   - Additional “in-transit” ports where the flight lands should be reported. Flights that transits through the U.S. must be reported as both an International Inbound and an International Outbound flight in two separate PAXLST messages. (Refer to rule #4 below).

3. Date/Time Reporting:
   - It is expected that the first airport reported in the itinerary will only have a scheduled Departure date/time, and the last reported airport will only have an Arrival date/time.
4. Flights Transiting Through the U.S.:
   • If a flight transits through the U.S., it must be reported as both an Inbound flight and an Outbound flight. (Refer to rule #4 below.) For example, a flight itinerary of GIG – GRU – LAX – NRT would be reported as:
     • An Inbound flight, with itinerary
       LOC+125+GRU
       LOC+87+LAX
       *(Required DTM segments not shown)*
     • An Outbound flight, with itinerary
       LOC+125+LAX
       LOC+87+NRT
       *(Required DTM segments not shown)*
   • It is logically impossible for the APIS system to process a transmission as both Inbound and Outbound. So, a flight that transits through the U.S. must be reported in two transactions, one for the Inbound leg(s) and one for the Outbound leg(s). For example, a London – New York – Toronto flight must be split into two transmissions, one for London – New York and the other for New York – Toronto. The London – New York leg will be processed as an Inbound flight and the New York – Toronto leg will be an Outbound flight. If it is not reported this way, DHS will not recognize the New York – Toronto leg as an Outbound flight.

   This condition also applies to “round robin” flights where a carrier operates a round-trip flight that leaves and returns to the U.S. (or enters and then leaves the U.S.) under a single flight number. As above, report this type of flight using two separate transmissions.

5. Determining Inbound or Outbound status:
   • Inbound/Outbound status is vital to correct processing of the flight, as it controls a number of system and manual processes that are significantly different. The PAXLST format does not have a way to explicitly report that the flight is arriving into the U.S. or departing from the U.S.; the country where the first airport in the itinerary is located determines this. If the first airport is in the U.S., the flight is Outbound; if the first airport is outside the U.S., the flight is Inbound.

A.4. Group 4 – Persons

Note: Coding rules for Person segments on Master Crew Lists and Crew member manifests are different. In particular, additional segment types may be required for crew members, and the structure of certain segments is different for crew members than for passengers. Refer to Appendix G.1.2.

   • At least one occurrence of this group is mandatory. A message sent without any travelers will be received and stored but will not be processed, and might not be acknowledged.
Carriers are strongly encouraged to avoid sending messages without traveler names. Processing of blank blocks of data negatively affects the efficiency of APIS processing.

- This group consists of a number of segments. The following order of transmission must be followed for each traveler:
  - NAD Traveler Type, Name, and Address
  - ATT Gender
  - DTM Date of Birth
  - LOCs Traveler’s Itinerary, and Country of Residence (if provided)
  - EMP Crew / Non-crew Status/Function (if provided)
  - NAT Nationality/Citizenship
  - RFF Passenger Name Record (PNR) Locator and Unique Passenger Reference
  - Group 5 Documents (refer to section A.5)

Note: If a traveler’s segments are transmitted in a different order, the traveler might not be processed correctly. Also, subsequent travelers in the message might be discarded and not processed at all. This could result in penalties to the carrier.

- The NAD segment is mandatory for each traveler. The presence of an NAD segment indicates the beginning of data for a new traveler.

Carrier accuracy is based on matching the data transmitted via APIS to the data provided by the arriving traveler, therefore carriers should base their data on the traveler’s identification document (usually a passport). The ICAO standard for machine-readable documents has 2 name fields (Surname and Given Name, separated by “<<” characters) and allows numerous sub-fields (separated by “<”). The NAD segment allows up to 3 fields for name components and allows embedded spaces. In general, a name scanned from a document can be transmitted using 2 NAD fields – for sub-fields, the “<” character should be converted to an embedded space. Special characters, such as an apostrophe, should also be converted to spaces. Examples of this are given in the description of the Group 4 NAD segment in section 16.

- If data is transmitted for a traveler via one or more ATT, DTM, LOC, EMP, NAT, RFF, and/or DOC segments, and there is no preceding NAD for the traveler, data for subsequent travelers in the transmission may be lost.

- The NAD’s Party Function Code Qualifier should be consistent with the document type code list that appears on the BGM segment.

- The CBP APIS Final Rule has established rules for name and address reporting using the NAD segment. Refer to the APIS regulations for clarification.

- The ATT and DTM segments are mandatory.
• Rules for reporting data using various LOC segments have been established by CBP.
  • LOC segments are used to report the traveler’s Country of Residence and Itinerary (Embarkation, Debarkation, and Customs Clearance locations).
  • The traveler’s itinerary is especially important when it does not correspond exactly to the flight itinerary that was reported in Segment Group 3.
  • Even if the traveler’s itinerary does match the flight itinerary, it must still be reported for the traveler in Group 4 LOC segments.

• The EMP segment is only used on crew manifests and MCLs.

• The NAT segment is mandatory.

• As required under the Secure Flight Final Rule (Oct 2008), both the Passenger Name Record Locator and the Unique Passenger Reference number must be supplied to identify a Passenger in the PAXLST. Therefore at least two (2) RFF segments must be present within the NAD Name loop.

• Rules for reporting PNR data using the RFF segment have been established by the CBP APIS Final Rule. Refer to the APIS regulations for clarification.

A.5. Group 5 – Documents

Note: Document segment rules are the same for Passenger and Crew member manifests and MCLs. However, the required types of documents may be different.

This group is subordinate to Group 4. In the IATA/WCO standard, it consists of 0 to 2 loops, each containing 1 DOC segment, 0 to 2 DTM segments, and 0 or 1 LOC segment.

• The Group 5 segments should be transmitted in the following order:
  • DOC (Document Type code and Number)
  • DTM (Date of Expiration – if applicable)
  • LOC (Country of Issue – if applicable)

• The DOC segment is mandatory if the group appears. If document data is transmitted for a traveler via one or more DTM and/or LOC segments, and if there is no preceding DOC for the document, data for subsequent travelers in the transmission may be lost.

• The DOC segment has the Type code and the Number. Refer to the description of the Group 5 DOC segment in section 23.

• The DTM segment reports the document’s expiration date, if applicable. Refer to the description of the Group 5 DTM segment in section 24.
• The LOC segment reports the country that issued the document, if applicable. Refer to the description of the Group 5 LOC segment in section 25.
Appendix B. Business Scenarios and Message Examples

Following are examples of Aircraft Operator's PAXLST passenger messages followed by the DHS CUSRES response, if applicable. Some of the examples include segments used for reporting Crew member manifest data. Examples of Master Crew Lists and Crew member manifests are shown in Appendix G. The following notes apply to all examples:

- Examples may use data that resembles real airlines and individuals. Any resemblance to actual airlines or individuals is coincidental and does not imply that the airlines or individuals took the actions being reported by the example.

- For clarity, example messages in this guide are shown with a line break between segments. This is completely arbitrary and line breaks have no meaning in the syntax. (Refer to example B.1). Messages must be transmitted as a continuous bit stream.

- None of the examples show any communications header or trailer data that may be required by SITA, ARINC, or any other network. Details of any such data is outside the scope of this guide.

- Where the example shows a complete APIS transmission, it may be too long to fit into size limitations of various message types. The examples do not show this, and it may be necessary for the message to be split into two or more blocks that will be transmitted separately. If this is done, each block must have a complete set of header/trailer segments, a BGM segment, and flight ID and flight itinerary segments. (Note: It is our understanding that SITA Type B messages can be 64K long and ARINC Type B messages can be 32K, so it is less likely that multiple blocks will be needed.)

- In some examples, notations of certain items are shown in parentheses and italic font.

- In some examples, information may have been intentionally left out due to space limitations.

Table 14 identifies the two position response code that will appear on the DHS Response CUSRES message in the ERC segment. Position 1 identifies the Boarding Pass Printing Result. Position 2 identifies the ESTA status for the traveler.

B.1. Sample UN/EDIFACT PAXLST Message, Displayed with Arbitrary Line Breaks

This message is shown with line breaks that are defined by the page width and Microsoft Word formatting rules. It can be seen that the message segments are contiguous, and there is no intervening break between the terminator of one segment and the segment label of the next.

B.2.1. DHS Response

The following DHS response message is based on the sample message from Section B.2. DHS Response Messages are identified within the BGM segment with a document type code of "962", DHS Response. Within this sample, the passengers have a cleared status. The ESTA status returned will always be "Z" for domestic submissions. The message sequence number will be consistent with request message.

```

B.5.1. DHS Response

The following response message is based on the sample message from Section B.5. DHS Response Messages are identified within the BGM segment with a document type code of “962”, DHS Response. Within this example, all of the passengers have a cleared status. The ‘cleared’ status is identified within the ERC segment following each passenger name record locator (e.g., PNR), and the associated passenger reference number. The ESTA status returned identifies that the passenger is traveling on a VWP passport with approved travel authorization via ESTA. The message sequence number will be consistent with request message.

B.6.1. DHS Response

The following response message is based on the sample message from Section B.??.
DHS Response Messages are identified within the BGM segment with a document type code of “962”, DHS Response. Within this example, all of the passengers have a cleared status. The ‘cleared’ status is identified within the ERC segment following each passenger name record locator (e.g., PNR), and the associated passenger reference number. The ESTA status returned is based either on the inclusion of a second document information or the passenger is traveling on a VWP passport with approved travel authorization via ESTA. The message sequence number will be consistent with request message.

B.7.1. DHS Response
The following response message is based on the sample message from Section B.6. DHS Response Messages are identified within the BGM segment with a document type code of “962”, DHS Response. Within this sample, all of the passengers have a cleared status. The ESTA status returned for each passenger indicates that the first passenger is traveling on a VWP participant passport and has approved travel authorization via ESTA. The second passenger, although traveling on a VWP participant passport, has NOT applied for a travel authorization via ESTA program.

The cleared status is identified within the ERC segment following the passenger name record locator (e.g., PNR) and associated passenger reference number. Refer to table 14 for all possible ERC segment values.
B.10. Flight Transiting through the U.S.

For flights transiting through the U.S., separate manifests must be reported for the Inbound and Outbound legs. The assumption is made that the carrier’s reservation and departure control systems have access to complete activity data for all travelers.

The following examples contain flight information of:
    Rio de Janeiro (GIG) – Sao Paulo (GRU) – Los Angeles (LAX) – Narita (NRT)

- The Inbound information is GIG – GRU – LAX.
- In this example, there are two Inbound transmissions:
  - One for the travelers boarding at GIG, with a transit through GRU
  - One for travelers boarding at GRU only

- The Outbound information is LAX – NRT.

- There is no explicit designation in PAXLST for Inbound or Outbound
- CBP has established a logic rule to identify Inbound and Outbound:
  - A flight is considered “Outbound” if the airport in the LOC+125 segment is an identified US airport, e.g., LAX

During the course of the flight, 3 passengers are carried:

- P1 boards in GIG and stops in LAX.
  - Reported on inbound transmission #1
- P2 boards in GRU and transits to NRT.
  - Reported on both inbound transmission #2;
  - and the outbound transmission #3
- P3 boards in LAX, and goes to NRT
  - Reported on the outbound transmission #3.
B.10.1. Inbound Reporting – Transmission #1
For travelers known at time of departure from GIG.

B.11. Gate Pass Request – (Secure Flight reporting)

*Message sample identifies information reporting for Secure Flight purposes only.*

For Gate Pass issuance, a transmission would contain one single Passenger with no flight itinerary. The Airport Location would be identified with a LOC code ‘91’. Gate-pass requests are identified within the BGM segment with a document type ‘655’ for Gate Pass. The passenger must be uniquely identified by the requesting Aircraft Operator using BOTH a PNR identifier and Unique Passenger Reference identifier.

```

The cleared status is identified within the ERC segment following the transaction Reference number and message sequence number. Refer to table 14 for all possible ERC segment values.
B.12. Qualified Change (AQQ and Secure Flight reporting)

PRD submissions for qualified change(s) against passenger data are identified within the BGM segment with a document identifier of ‘CP’ in the BGM-02 data element. In the below example, the qualified change is for a date of birth change for a single passenger. The message sequence number is 2. All passengers identified in the Change Passenger data ‘CP’ type PAXLST transmission are processed as changes to all of the passengers.

The following reduction in party example is based on the previous sample message from Section B.12. PRD submissions for Reduction in Party are identified within the BGM segment with a document identifier of “RP”. The message contains all remaining passengers associated to the same passenger locator reference (e.g., PNR) in which the reduction in party occurred. Passenger(s) not transmitted within the reduction in party message are assumed to be cancelled. In the sample message below, CLARK, CHERYL was not transmitted and will therefore be marked accordingly by DHS as the reduction in party under PNR TYR123. Message sequence number is set to 3.

B.16. DHS Unsolicited Message ‘Not-Cleared’

The following response message illustrates a CUSRES Unsolicited Message that may be sent to the aircraft operator in the event changes occur to the passenger status of a previously vetted passenger. In this example, a ‘Not-Cleared’ condition is being reported to the aircraft operator. DHS Unsolicited Messages are identified within the BGM segment with a document type code of “132”, DHS Clearance Notice. The Unsolicited Message identifies a change to the passenger status. The new status is identified within the ERC segment following the passenger name record locator (e.g., PNR) and associated passenger reference number. The ESTA status returned for all “Inhibited” returned results will equal “1”. (This type of message from DHS must be responded to by the Aircraft Operator. See next example.)

B.16.1. Aircraft Operator Response to DHS Unsolicited Messages

The following response message illustrates a response generated by the aircraft operator that must be returned to DHS upon receipt of an Unsolicited message from DHS. The response from the aircraft operator should be returned to DHS virtually intact and include an indicator that identifies to DHS the status of issuance of a boarding pass. (Refer to FTX segment below). The TRN number on the RFF+TN segment must be returned to DHS on this message.

B.17. Cancelled Flight – (AQQ reporting)

*Message sample identifies information reporting for AQQ purposes only.*

The following PAXLST message illustrates a cancellation of a flight message. Submissions for cancelled flights are identified within the BGM segment with a document type code ‘266’ and message function identifier of “XF” (Cancel Flight). The message contains the identity of the flight to be cancelled (TDT segment) along with the full flight itinerary. In the sample message below, the message sequence number is incremented to indicate order in which message was generated by the aircraft operator system.

DHS General Response ('1')

Note: The DHS response (CUSRES) message for a Flight Close-out message will be a DHS General Response identified by an ERP segment with a value of 1 (ERP+1). No passenger status will be returned on this type of DHS Response message. The returned ERC segment will contain a single code identifying acceptance of the message by DHS.

This example is NOT intended for AQQ or Secure Flight reporting. This example clarifies APIS reporting of combined passenger and crew information within a single transmission. Note the use of ‘USCSAPIS’ identifier in the UNB Interchange Receiver ID element.

Flight/Route: JL #16, NRT – SEA

This is an example of a transmission that contains both a Crew list and a Passenger list.
- There is one set of UNA, UNB, UNG, UNE, and UNZ segments for the entire transmission. The UNE group count is 2, since there are two lists.
- There are two UNH – UNT loops, or “messages,” one for each list. Note that the first has a message reference of “PAX001,” and the second has a reference of “PAX002.”
- The first list (Crew) has a BGM value of 250; the second list (Passengers) has a BGM of 745. The order of the lists is not important.
- Since both lists should refer to the same flight, the segments in Groups 2 and 3 (TDT, LOC, DTM) for flight identification and itinerary are the same.

This example includes changes for TSA crew requirements:
- BGM Flight Type code of “CC” (Passenger Flight, Crew Change)
- Home address for crew members on Group 4 NAD
- Place of Birth on Group 4 LOC

Information may have intentionally been omitted from this example for space considerations.

(Passenger count)
(End of 2nd UNH – UNT “message”)
B.21. Uniquely Identifying a Transmission and Messaging Order

Aircraft operators are required to provide passenger data for the following events to DHS as they may occur on a particular passenger reservation. Each must be reported to DHS on separate PAXLST messages in the order in which they occur.

- Adds
- Updates (Qualified and Non-Qualified)
- Reduction in Party
- Cancellation of Reservation

This reporting requirement is accommodated and identified through the use of the Transaction Reference Number (TRN) and message sequence number, both mapped to RFF segment. When provided, the RFF in its entirety will be echoed back in the CUSRES message.

Note: Use of the TRN and the message sequence number for chronological representation is optional. The use of the message sequence number for subsequent message processing is supported by Secure Flight only.

Table 15: Transmission and Sequence of Order Identifiers

<table>
<thead>
<tr>
<th>Data Element</th>
<th>Sub-elements</th>
<th>Conditions</th>
<th>Format / Values</th>
<th>PAXLST Segment(s) (+ Function Qualifier Code) / Element(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transaction Reference Number</td>
<td>• Reference code qualifier&lt;br&gt;• Reference identifiers&lt;br&gt;• Revision identifiers</td>
<td>Entire segment is conditional/optional. Used at the discretion of the aircraft operator to manage messages</td>
<td>Group 0 RFF + TN / 1154</td>
<td></td>
</tr>
</tbody>
</table>

Transaction Reference Number

The value in this data element represents a Transaction Reference Number (TRN) that may be used by the carrier system to track/reconcile responses from DHS air passenger reporting systems. The value in this element will be returned in the DHS response message (CUSRES) within the RFF segment in that message. Up to 25 bytes of data may be sent in this element. The value assigned by the Aircraft Operator may contain alpha and numeric characters, and may include pound sign (#), dash (-), and period (.).
Message Sequence Number

The numeric value in this data element may be used to identify the sequence of the message as relates to chronological updates applied to the same passenger manifest. The sequence number should be incremented by +1 to reflect the implied revision sequence to the manifest.

Common Access Reference

This element appears on the UNH segment and may be used as a message response verification reference similar to that of the TRN identified above. The value sent by the aircraft operator in this data element will be returned similarly on the UNH segment within the CUSRES message set.
Message Example

The following domestic messages highlight the usage of the Transaction Reference Number and the Message Sequence Number within the RFF segment.

The following examples depict the sequence of two transmissions. The 1st transmission contains a passenger name. The 2nd transmission contains additional information collected on the passenger. The order of events (e.g., initial data collection, followed by additional collection) is communicated using the message sequence number.

1st Transmission: Collection of Passenger Itinerary and name information for a specific reservation. Aircraft Operator assigns a Transaction Reference Number of “AJYTR1070219” to the transmission for system tracking purposes. The following example assumes that this is the first transmission for this passenger reservation number of “Z2JM6O”. The Message sequence number is initialized to “1”.

```
UNA:+.?

DTM+232:0702181955:201' Flight scheduled arrival date/time
NAD+FL+++BARRETT:TODD' Surname and First Name
LOC+178+ORD' Passenger started journey
LOC+179+JFK' Passenger’s destination
RFF+AVF:Z2JM6O' Passenger identification (PNR)
RFF+ABO:ABC123’ Aircraft operator Unique Passenger reference identifier
CNT+42:1' Represents the total passengers reported in this transmission.
UNT+16+PAX001'
UNE+1+1'
UNZ+1+000000001'
```
2nd Transmission: Aircraft operator now collects the date of birth and gender for passenger reservation number of “Z2JM6O”. This type of data collection is classified has a qualified change to the passenger reservation and requires a 2nd transmission. Aircraft Operator retains the Transaction Reference Number of “AJYTR1070219” for system tracking purposes and increments the message sequence number to ‘2’. The message type is a ‘CP’ – Change Passenger’.

The above examples demonstrate the usage of the message sequence number to reflect the implied revision sequence to the manifest. This method should also be performed when transmitting:

- Non-Qualified Changes
- Reduction in party
- Cancellation of Reservation
B.22. Uniquely Identifying a Passenger

A Passenger Record Number Locator, or equivalent unique identifier must be provided. This unique identifier shall be used by DHS in the response message and any required acknowledgements from the aircraft operator. This requirement is accommodated through the usage of multiple RFF segments. A passenger name record locator must be provided using the RFF segment with a function qualifier of “AVF”. If the passenger name record locator is not unique, or not available, the aircraft operator must send a value in the RFF using a derived default value of up to 6 bytes of data. A Unique Passenger Reference (UPR) identifier must also be provided using the RFF segment with a function qualifier of “ABO”. The value assigned by the aircraft operator for the UPR may contain alpha and numeric characters, and may include pound sign (#), dash (-), and period (.).

All RFF segments provided will be echoed back in their entirety within the CUSRES response message.

Table 16: Passenger Unique Identifiers

<table>

Appendix D. Coding Rules for TSA Crew Member Reporting

D.1. Introduction

This appendix describes the requirements and rules for using APIS to report crew member data to comply with the Transportation Security Administration (TSA) requirements. Requirements are described for the electronic submission of:

- APIS Crew Manifests
- Master Crew List (MCL)

For the most part, these messages are coded the same way as for passenger manifests, as described in Appendix “A”. However, there are some important differences, which are described in this section.

D.1.1. Data Requirements

The following data elements shall be transmitted to fulfill both APIS crew manifest and Master Crew List (MCL) requirements:

- Flight Crew Status
- Last Name
- First Name
- Middle Name
- Date of Birth
- Gender
- Document Type
- Document Number
- Document Country Code
- Pilot License Number and Issuing Country Code
- Country of Residence
- Home Address
- Place of Birth

Refer to the table of MCL data elements and their coding rules in section 2.4 for more details.
D.1.2. APIS Crew Manifest

Carriers shall communicate the following crew manifests for both passenger and cargo flights:

- Crew members of passenger and cargo flights arriving into the United States
- Crew members of passenger and cargo flights departing the United States
- Crew members of passenger and cargo flights overflying the United States
- Crew members serving on flights arriving internationally, with domestic continuance to other U.S. airports (foreign carriers only)
- Crew members that serve on flights inside the United States with domestic continuance on to U.S. airports, prior to an international departure (foreign carriers only)
- Crew changes for all such flights, except overflights.

Carriers are required to identify each crew manifest by suffixing the flight number with one of the codes identified in Table 10, "Crew Manifest Flight Type Codes":

<table>
<thead>
<tr>
<th>Code</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>Passenger Flight, Regularly Scheduled Crew</td>
</tr>
<tr>
<td>CC</td>
<td>Passenger Flight, Crew Change</td>
</tr>
<tr>
<td>B</td>
<td>Cargo Flight, Regularly Scheduled Crew</td>
</tr>
<tr>
<td>BC</td>
<td>Cargo Flight, Crew Change</td>
</tr>
<tr>
<td>A</td>
<td>Overflight, Passenger Flights</td>
</tr>
<tr>
<td>D</td>
<td>Overflight, Cargo Flights</td>
</tr>
<tr>
<td>E</td>
<td>Domestic Continuance, Passenger Flight, Regularly Scheduled Crew</td>
</tr>
<tr>
<td>EC</td>
<td>Domestic Continuance, Passenger Flight, Crew Change</td>
</tr>
<tr>
<td>F</td>
<td>Domestic Continuance, Cargo Flight, Regularly Scheduled Crew</td>
</tr>
<tr>
<td>FC</td>
<td>Domestic Continuance, Cargo Flight, Crew Change</td>
</tr>
<tr>
<td>G</td>
<td>Master Crew List, Add Record</td>
</tr>
<tr>
<td>H</td>
<td>Master Crew List, Delete Record</td>
</tr>
<tr>
<td>I</td>
<td>Master Crew List, Change Record</td>
</tr>
</tbody>
</table>

The absence of one of the above Crew Manifest Flight Type Codes will designate the submission as a passenger manifest and not as a Crew Manifest.

Carriers are required to identify the status of each crew member on a passenger or all-Cargo flight. "Non-crew members" on all-Cargo flights must also be reported and identified. Use one of the codes identified in Table 11 – "Status Identification Codes":

<table>
<thead>
<tr>
<th>Code</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>FM</td>
<td>“Crew members” include pilots, copilots, flight engineers, airline management personnel, cabin crew, and any relief or deadheading personnel in any of these categories.</td>
</tr>
<tr>
<td>CR1</td>
<td>Cockpit crew and individuals inside cockpit.</td>
</tr>
<tr>
<td>Code</td>
<td>Definition</td>
</tr>
<tr>
<td>------</td>
<td>------------</td>
</tr>
<tr>
<td>CR2</td>
<td>Cabin crew (e.g. flight attendants).</td>
</tr>
<tr>
<td>CR3</td>
<td>Airline operations management with cockpit access (e.g. instructors, safety personnel)</td>
</tr>
<tr>
<td>CR4</td>
<td>Cargo non-cockpit crew and “non-crew” members. This includes aircraft operator employees, family members, and persons transported for the safety of the flight (e.g. animal handlers) who are not classified as one of the “crew member” groups. <strong>Applies only to all-cargo flights.</strong></td>
</tr>
<tr>
<td>CR5</td>
<td>Pilots on board but not on duty (e.g. deadhead)</td>
</tr>
</tbody>
</table>

Coding rules for crew member manifests are normally the same as for passenger manifests, as described in Appendix “A” with exceptions noted for crew members. (Also refer to specific business data element coding requirements listed in Section 2.5 / Table 6, “Coding Rules for Arrival Manifest Data – Crew and Non-Crew” and Section 2.6 / Table 7, “Coding Rules for Departure Manifest Data – Crew and Non-Crew”.) The following rules for coding the Group 3 Flight Itinerary are different enough to be described in this section:

**Coding Rules: Group 3 – Flight Itinerary**

There are some important differences in coding Group 3 between passenger manifests, crew member manifests, and Master Crew Lists. This section applies only to crew member manifests – passenger manifests are described in Appendix A.3 and Master Crew List coding rules are described in Appendix D.2.

This group is subordinate to Group 2. In the WCO/IATA/ICAO standard, it consists of 2 to 10 loops, each containing a LOC segment and 1 or 2 DTM segments. The LOC reports an airport in the flight’s itinerary, and the DTM(s) report the scheduled Arrival and Departure date/time at that airport (in the local time zone).

**Maximum and minimum number of LOC – DTM loops:**
- **“Domestic Continuance” manifests:**
  A Domestic Continuance manifest is only required if: (a) the carrier is a foreign-flagged carrier; and (b) the flight arrives at or departs from a U.S airport; and (c) the crew list on the flight for any segment within the U.S. differs from the crew list when the flight crossed the U.S. border. (For example, an inbound flight picks up a crew member in the U.S. and proceeds to another U.S. airport, or a crew member on an outbound flight boarded at one U.S. airport then leaves the flight before the flight departs the U.S.) If this is not the case, a Domestic Continuance manifest is not needed – the flight is reported as a normal passenger or all-cargo flight, and the maximum and minimum number of LOC-DTM loops is the same as that stated in Appendix A.3.

- All U.S. segments must be reported, using a Location Function Code Qualifier of “92”. Report a maximum of 9 such airports. Only one foreign airport is reported:
On inbound flights, it is the airport of the last foreign departure before arrival in the U.S., and has a Location Function Code Qualifier of “125”.

On outbound flights, it is the airport of the first foreign arrival after departure from the U.S., and has a Location Function Code Qualifier of “87”.

“Overflight” manifests:
An Overflight manifest overflies U.S. territory without ever landing at a U.S. airport. (It may land at a U.S. pre-clearance airport, e.g. Montreal, located in a foreign country.)

Only report the airports where the flight lands immediately before and immediately after overflying U.S. territory, using Location Function Code Qualifiers “125” (location of departure) and “87” (location of arrival). Normally, there will only be 2 such airports.

“Progressive”, Pre-clearance, and Final Destination airports:
- “Progressive” flights are considered the same as “domestic continuance” flights, and are coded using the rules in the “Maximum and minimum number of LOC-DTM Loops” section described above.
- “Pre-clearance” of inbound travelers is done at a few foreign airports before the flight departs for entry into the U.S. (for example, in Montreal for a flight to New York). These flights are coded using the same rules as Appendix A.3.
- Final destination is coded using the same rules as Appendix A.3.
- A flight that transits through the U.S. must be reported as both an Inbound and an Outbound flight in two separate PAXLST messages.

Date/Time Reporting:
- This follows the same rules as Appendix A.3.

Flights Transiting Through the U.S.:
- If a flight transits through the U.S., it must be reported as both an Inbound flight and an Outbound flight in two separate PAXLST messages.
D.1.3. Master Crew List

Carriers are required to electronically transmit a list via APIS of all employed crew members, using the same mechanism as used to transmit crew member(s) of scheduled flights. This electronic transmission does not constitute a real flight arrival, departure, or overflight. Its sole purpose is to allow TSA to electronically receive and “authorize” a carrier’s crew member(s). **Crew members who have not been authorized prior to serving on one of the flight types in Table 10 – “Crew Manifest Flight Type Codes” may be detained upon arrival in the U.S, and the carrier may face penalties.**

Coding rules for MCLs shall follow the UN/EDIFACT message syntax standards defined in this Implementation Guide. These are normally the same as for passenger manifests, as described in Appendix “A” with exceptions noted for crew members and MCLs. (Also, refer to Section 2.4 / Table 5, “Coding Rules for TSA Master Crew List Data” for requirements of specific data elements.) Following is a list of specific exceptions or clarifications to the Appendix “A” rules:

- In the UNB segment, Sender ID, for all senders, shall always read ‘MCCL*TSA’. This is regardless of the Sender ID used for any other type of APIS transmission.

- In the BGM segment, Document Identifier will be ‘G’ for adds (i.e. a new crew member), ‘H’ for deletes (i.e. the crew member is to be removed from the MCL), or ‘I’ for changes (to a previously filed crew member).

- In the TDT segment:
  
  - Flight Number format shall be ‘cccxxMCL’ where:
    - ‘ccc’ is the carrier’s IATA carrier code (either 2 or 3 characters)
    - ‘xx’ is a sequence number (01-99). The first MCL sent on a given day will have “01”, the second “02”, up to “99”. (There is a limit of 99 MCL messages on any given day.)
  
  - A single transaction must not exceed 5,000 crew members. Multiple transactions shall be required for carriers with an MCL that exceeds 5,000 crew members. As described above in the flight number format, the carrier shall increment the sequence number for each transaction that reports additional crew members on the same day.

- Group 3 Flight Itinerary:
  
  Only 2 “airports” are coded:

  - First “airport”:
    
    - The LOC segment must have a Location Function Code Qualifier of “188” (for Filing Location), and a Location Name Code of “XXX”.
    
    - The DTM segment must have a Location Function Code Qualifier of “554” (for Filing Date), and the current date in YYMMDD format. (If the date is formatted as CCYMMDD, a Date/Time Period Format Code of “102” must follow the date.)
- Second “airport”:
  - The LOC segment must have a Location Function Code Qualifier of “172” (for Reporting Location), and a Location Name Code of “TST”.
  - The DTM segment must have a Location Function Code Qualifier of “554” (for Filing Date), and the current date in YYMMDD format. (If the date is formatted as CCYYMMDD, a Date/Time Period Format Code of “102” must follow the date.)
- Subsequent transactions that add, delete, or update crew members shall have DTM segment to report the date of when the addition, deletion, or update occurred.
D.2. Master Crew List Coding Examples

D.2.1. Master Crew List, Adding Crew Member Records

Description
This message is used to report additions to the list of crew members that might be assigned to one of the carrier’s flights for which manifests must be reported. Section G.1.3, Table 10 – “Crew Manifest Flight Type Codes” lists those types of flights. The coding rules for individual data elements are described in Section 2.4, Table 5, “Coding Rules for TSA Master Crew List (MCL) Data”. (Note the use of ‘USCSAPIS’ identifier in the UNB Interchange Receiver ID element.)

Example

Flight/Route: Lufthansa is the carrier. There is no flight / route – the MCL is not for a specific flight. The TDT flight number is always the same for a given carrier, except for a sequence number within the date of the report (on Group 3 DTMs following the Group 3 LOCs). The Group 3 LOC segments have fixed values. Since the MCL is not for a specific flight, there is no itinerary for the crew members.

Information may have intentionally been omitted from this example for space considerations.

LOC+91+GER‘
CNT+41:1‘
(1 total crew reported on this MCL message)
D.2.2. Master Crew List, Deleting Crew Member Records

Description
This message is used to report deletions of crew members from a previously reported MCL (refer to section G.2.1 “Master Crew List, Adding Crew Member Records”). The data reported in this transaction will identify the crew member to be deleted. The BGM Document Identifier / Flight Type will have a suffix of “H” instead of “G”.

Example
The following example represents a manifest that reports deletions of previously reported crew members. Only the BGM line is shown – all other aspects of the manifest are the same as in example G.2.1, and must be used for adequate processing.

BGM+336+H'  
(“336” is always used on an MCL; “H” is a “Delete”)

Note: A crew member previously reported on an MCL will not be deleted unless an exact match can be found to a previous record. At minimum, this requires the following crew member identification:
- Last and First Names (and Middle, if previously reported)
- Date of Birth

Additional data elements will help ensure a successful deletion, and reduce the need to resolve duplicate or missing crew members. These elements include:
- Gender
- Document Type, Number, and Issuing Country
- Pilot License number and country of issuance

D.2.3. Master Crew List, Changing Crew Member Records

Description
This message is used to report changes to data values for crew members who have previously been reported on an MCL transaction (refer to section G.2.1 “Master Crew List, Adding Crew Member Records”). The data reported in this transaction will replace previously reported data, therefore all data elements must be reported, not just those being changed. Change records will resemble the “Master Crew List, Adding Crew Member Records” transaction, but the BGM Document Identifier / Flight Type will have a suffix of “I” instead of “G”.

Example
The following example represents a manifest that reports changes to previously reported crew members. Only the BGM line is shown – all other aspects of the manifest are the same as in example G.2.1, and must be used for adequate processing.

BGM+336+I'  
(“336” is always used on an MCL; “I” is a “Change”)
D.3. Flight Manifest Coding Examples

D.3.1. Passenger Flight, Regularly Scheduled Crew

Description
This reports the crew members scheduled to work a flight. It must be filed no later than 1 hour before scheduled takeoff from the last foreign port of departure for the U.S. The flight number has a suffix of “C”.  (*Note the use of ‘USCSAPIS’ identifier in the UNB Interchange Receiver ID element.*)

Example

**Flight/Route:** Quantas #123, SYD – HNL

The reported crew member (a pilot) is a Canadian citizen residing in the U.S. Note the time difference of more than 1 hour between the UNB / UNG (12:35) and the departure DTM (15:40) segments. This example includes changes for new TSA crew requirements:

- Flight Type of “C” on the BGM (Passenger Flight, Regularly Scheduled Crew)
- Home address for crew members on Group 4 NAD
- Place of Birth on Group 4 LOC
- Status details code on Group 4 EMP
- Document (Group 5 DOC) and Place of Issue (Group 5 LOC) for Pilot’s License

Information may have intentionally been omitted from this example for space considerations.

D.3.2. Passenger Flight, Crew Change

Description
A crew “change” means that a carrier is submitting additional and/or replacement crew members for the flight less than 1 hour prior to the flight’s departure. (Do not report crew member deletions from the flight via APIS transmissions.) A crew change does not represent data value changes, such as document number or address, for crew members who have already been reported for the flight.

It differs from a “Passenger Flight Regularly Scheduled Crew” manifest by having a BGM Flight Type Code of “CC”. *(Note the use of ‘USCSAPIS’ identifier in the UNB Interchange Receiver ID element.)*

Example

**Flight/Route:** JL #16, NRT – SEA

A crew member has been added to a flight less than 1 hour before takeoff for the U.S. from the last foreign port of departure. Note the time difference of less than 1 hour between the UNB / UNG (15:20) and the departure DTM (15:40) segments. This example includes changes for new TSA crew requirements:

- Flight Type of “CC” on the BGM (Passenger Flight, Crew Change)
- Home address for crew members on Group 4 NAD
- Place of Birth on Group 4 LOC

Information may have intentionally been omitted from this example for space considerations.

D.3.3. Cargo Flight, Regularly Scheduled Crew

**Description**
A cargo flight is one that does not transport paying passengers. APIS should never receive a passenger manifest for a cargo flight. However, any “non-crew members” on the flight (as described in Table 11 – “Status Identification Codes”) must be reported on the crew manifest using a Group 4 NAD segment Party Function Qualifier Code (“Status”) of “CR4”.

A “Cargo Flight Regularly Scheduled Crew” manifest differs from a “Passenger Flight Regularly Scheduled Crew” manifest by having a Flight Type of “B” on the BGM.

**Example**
The only difference from example G.3.1 is the BGM segment.

```
BGM+250+B' (Flight Type of ‘B’ for cargo flight, scheduled crew)
```
D.3.4. Cargo Flight, Crew Change

Description
A crew “change” means that a carrier is submitting additional and/or replacement crew members for the flight less than 1 hour prior to the flight’s departure. (Do not report crew member deletions from the flight via APIS transmissions.) A crew change does not represent data value changes, such as document number or address, for crew members who have already been reported for the flight.

It differs from a “Cargo Flight, Regularly Scheduled Crew” manifest by having a Flight Type of “BC” on the BGM.

Also, all-cargo flight manifests must report any “non-crew” crew on board, using a Group 4 NAD segment Party Function Qualifier Code (“Status”) of “CR4” (refer to Table 11 – “Status Identification Codes”).

Example
The only difference from example G.3.2 is the BGM segment.

BGM+250+BC’ (Flight Type of ‘BC’ for cargo flight, crew change)
D.3.5. Overflight, Passenger Flights

Description
An overflight is a flight that passes over U.S. airspace without ever landing at a U.S. airport. Only a crew manifest is required at this time.

The PAXLST message for reporting Crew on a Overflight for a Passenger flight is uniquely identified with:

- BGM+250+A
- LOC Segments containing non-US airport locations

Example
The differences from example G.3.1 are the BGM segment, and no U.S. airport in the flight itinerary.

DTM+189:0802190915:201'  
LOC+87+MEX'  
DTM+232:0802191357:201'

(Flight Type of 'A' for passenger overflight)
(Departure from Toronto)
(Arrival at Mexico City)
D.3.6. Overflight, Cargo Flights

Description
A cargo overflight is one that flies over U.S. airspace without ever landing at a U.S. airport. Only a crew manifest is required, at this time.

An “Overflight Cargo” manifest differs from an “Overflight Passenger Flight” manifest by having a Flight Type of “D” on the BGM.

Also, all-cargo flight manifests must report any “non-crew” crew on board, using a Group 4 NAD segment Party Function Qualifier Code (“Status”) of “CR4” (refer to table 11, “Status Identification Codes”).

Example
The only difference from Passenger Flight Overflight example shown in D.3.5 is the coding of the BGM segment.

BGM+250+D’ (Flight Type of ‘D’ for cargo overflight)
D.3.7. Domestic Continuance, Passenger Flight, Regularly Scheduled Crew

Description
For an arriving flight, a “domestic continuance” flight is one that flies to additional U.S. airports after the initial U.S. arrival airport. For a departing flight, a “domestic continuance” flight is one that lands at other U.S. airports before the U.S. port of final departure.

A separate Domestic Continuance manifest is only required if crew members will differ between the international and domestic segments of the flight – if the crew manifest is the same for all segments, no Domestic Continuance manifest is required. If one or more domestic continuance manifests are submitted, the flight itinerary must show the foreign port of departure and all U.S. airports flown to for the submitted manifest. The itinerary for each crew member being reported must show those airports where the crew member will embark and debark from the flight.

This type of manifest is used to report the crew members scheduled for a passenger flight prior to 1 hour before departure. This differs from an “Overflight Passenger” manifest by having a Flight Type of “E” on the BGM. (Note the use of ‘USCSAPIS’ identifier in the UNB Interchange Receiver ID element.)

Example

Flight/Route: Air France #789, CDG – JFK – ORD

The reported crew member (non-duty pilot) is joining the flight in New York for the flight segment to Chicago. The entire flight itinerary is reported, including the arrival and departure dates/times. The crew member’s itinerary only shows the JFK – ORD segment. (Note: the crew member is already in the U.S., so there is no U.S. arrival port / LOC+22.) This example includes changes for new TSA crew requirements:

- Flight Type of “E” on the BGM (Domestic Continuance, Passenger Flight, Regularly Scheduled Crew)
- Party Function (“Status”) Qualifier Code on Group 4 NAD of “FM” (not “CRx”).
- Home address for crew members on Group 4 NAD
- Place of Birth on Group 4 LOC
- Document (Group 5 DOC) and Place of Issue (Group 5 LOC) for Pilot’s License
Information may have intentionally been omitted from this example for space considerations.

D.3.8. Domestic Continuance, Passenger Flight, Crew Change

Description
For an arriving flight, a “domestic continuance” flight is one that flies to additional U.S. airports after the initial U.S. arrival airport. For a departing flight, a “domestic continuance” flight is one that lands at other U.S. airports prior to the U.S. port of final departure.

A separate Domestic Continuance manifest is only required if crew members will differ between the international and domestic segments of the flight – if the crew manifest is the same for all segments, no Domestic Continuance manifest is required. If one or more domestic continuance manifests are submitted, the flight itinerary must show the foreign port of departure and all U.S. airports flown to for the submitted manifest. The itinerary for each crew member being reported must show those airports where the crew member will embark and debark from the flight.

This type of manifest is used when a carrier is submitting additional and/or replacement crew members for the flight less than 1 hour prior to the flight’s departure. (Do not report crew member deletions from the flight via APIS transmissions.) This differs from a “Domestic Continuance, Passenger Flight, Regularly Scheduled Crew” manifest by having a Flight Type of “EC” on the BGM.

Example
The difference from example G.3.7 is the BGM segment.

BGM+250+EC'  (Flight Type of ‘EC’ for domestic continuance, passenger flight, crew change)
D.3.9. Domestic Continuance, Cargo Flight, Regularly Scheduled Crew

Description
For an arriving flight, a “domestic continuance” flight is one that flies to additional U.S. airports after the initial U.S. arrival airport. For a departing flight, a “domestic continuance” flight is one that lands at other U.S. airports prior to the U.S. port of final departure.

A separate Domestic Continuance manifest is only required if crew members will differ between the international and domestic segments of the flight – if the crew manifest is the same for all segments, no Domestic Continuance manifest is required. If one or more domestic continuance manifests are submitted, the flight itinerary must show the foreign port of departure and all U.S. airports flown to for the submitted manifest. The itinerary for each crew member being reported must show those airports where the crew member will embark and debark from the flight.

This type of manifest is used to report the crew members scheduled 1 hour prior to departure to work a cargo flight. This differs from a “Domestic Continuance, Passenger Flight, Regularly Scheduled Crew” manifest by having a Flight Type of “F” on the BGM.

Also, all-cargo flight manifests must report any “non-crew” crew on board, using an NAD segment Party Function Qualifier Code (“Status”) of “CR4” (refer to Table 20 – “Status Identification Codes”).

Example
The difference from example D.3.7 is the BGM segment.

BGM+250+F'  *(Flight Type of ‘F’ for domestic continuance, cargo, scheduled crew)*
D.3.10. Domestic Continuance, Cargo Flight, Crew Change

Description
For an arriving flight, a “domestic continuance” flight is one that flies to additional U.S. airports after the initial U.S. arrival airport. For a departing flight, a “domestic continuance” flight is one that lands at other U.S. airports prior to the U.S. port of final departure.

A separate Domestic Continuance manifest is only required if crew members will differ between the international and domestic segments of the flight – if the crew manifest is the same for all segments, no Domestic Continuance manifest is required. If one or more domestic continuance manifests are submitted, the flight itinerary must show the foreign port of departure and all U.S. airports flown to for the submitted manifest. The itinerary for each crew member being reported must show those airports where the crew member will embark and debark from the flight.

This type of manifest is used when a carrier is submitting additional and/or replacement crew members for the flight less than 1 hour prior to the flight’s departure. (Do not report crew member deletions from the flight via APIS transmissions.) This differs from a “Domestic Continuance, Cargo Flight, Regularly Scheduled Crew” manifest by having a Flight Type of “FC” on the BGM.

Also, all-cargo flight manifests must report any “non-crew” crew on board, using an NAD segment Party Function Qualifier Code (“Status”) of “CR4” (refer to Table 20 – “Status Identification Codes”).

Example
The difference from example D.3.7 is the BGM segment.

BGM+250+FC’ (Flight Type of ‘FC’ for domestic continuance, cargo, crew change)
